# HAATT ROLLER BEARINGS

Building quality into its own products for more than 38 years, has privileged Hyatto symbolize the protection which Hyatt Quiet Roller Bearings afford other quality products. It is the experience of the country's foremost automotive engineers that Hyatt Quiet Roller Bearings contribute all those qualities which are essential to the design of today's cars, trucks and buses.

They select Hyatt Quiet Roller Bearings because of the silent, efficient manner in which they harmonize with their objectives.

They realize how faithfully Hyatt quality preserves and protects the reputation of the quality products of which they become a part.

And today, after serving the automotive industry since its inception, Hyatt Quiet Roller Bearings enjoy a more wide-spread representation than ever before.

THE BENDIX BRAKE

Massive trucks and buses today travel with safety over the highways at hitherto unheard-of speeds, depending upon the instant and positive action of Bendix Brakes.

These Bendix heavy duty Brakes are engineered to control the momentum of tons of weight with the same smoothness and unfailing exactness found in Bendix Brakes for light automobiles.

Servo Action—exclusive with Bendix—multiplies pedal pressure to a mighty grip.

No truck too big-no load too heavy-there's a Bendix Brake for every job.

Consult our Engineering Department. Write for particulars.

A MESSAGE TO SICK FLEET OWNERS

WHETHER your trouble is "internal" or "external," here is a message that's not simply "brake lining bunk." . . . These are facts based upon practical experience in solving the brake lining problems of some of the largest traction companies and fleet owners in this country.

Our brake engineers have been successful in developing a heavy duty brake lining that is providing unusual service where lining must withstand severe strain and hard wear.

(Photograph of one of the luxurious Coaches, operated by the Baltimore Motor Coach Company, equipped with ALLTRAFFIC Brake Lining)

> The Baltimore Motor Coach Company has written us the following:

> "We are using ALLTRAFFIC Brake Lining and find none better. Our Coaches are used on tours throughout the United States in all kinds of weather."

> For complete information fill out the slip below and mail to us. Let us prescribe a remedy for your braking troubles.

DEALERS: Robert Bosch Vibro-Balanced Horns offer you an opportunity to make substantial extra profits and promote the prestige of your business at the same time. Read the remarkable story below . . . then send for additional information.

It beeped in Baltimore ... It beeped in Atlantic City ... It's still beeping in Long Island City!

T started beeping in Baltimore—this Robert Bosch FD-type Vibro-Balanced Horn. A prominent fleet owner there wanted to see how many times it would beep before it expired ... as a test of dependability. After it had beeped 201,000 times they had heard enough and turned it off.

Then it was set up during the Robert Bosch Exhibit at the American Railway Convention in Atlantic City. Visitors from all over the country beeped it ... and marveled that a horn which had been blown so many times still sounded like new.

Today the same horn is on display at our Long Island City showrooms. People are still beeping it ... as this goes to press the automatic counter registers 202,882...and there's no telling how many beeps are still left in this hardy Robert Bosch Horn.

What does it prove? It simply proves that Robert Bosch Horns give dependable, long-time horn servicewitness the fact that the 202,882 beeps registered to date are equivalent to over

two years' hard service on a truck or bus. It proves that Robert Bosch Horns will give trucks and buses super-safetywitness the fact that it has answered the button without failing even once in 202,882 times. There's real horn dependability for your customers.

When you sell a truck or bus, sell a Robert Bosch Vibro-Balanced Horn as especially desirable equipment. The few extra dollars cost to your customer will be more than justified by the horn dependability and safety that he will receive. He will remember you as a reliable, reputable dealer. Send today for additional information regarding the profitable Robert Bosch Franchise.

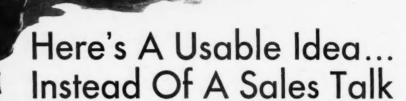

> All Robert Bosch Vibro-Balanced Horns bear the full name "ROBERT BOSCH" and this trademark of Robert Bosch A.-G.

Robert Bosch Vibro-Balanced HORNS

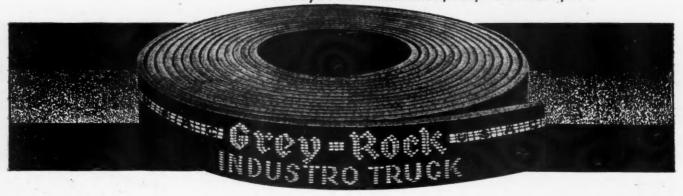

Every progressive fleet operator knows the importance of using good brake lining if brake maintenance costs are to be kept at a reasonable level. Yet many of these same operators go to as little trouble as possible in the selection of their brake lining.

With so many linings on the market—all claiming superior features and performance—it is no easy task to determine which is the best for your own particular job. Instead of buying brake lining because of high sounding statements in sales talks and advertising why not make the lining prove its superiority for itself? Test the various linings on your own trucks, carefully recording installation time and cost, readjustment time and cost, mileage, performance, wear on drums, etc. Such a test will cost a little time and money to conduct properly—but it may save you a lot of both on future brake maintenance.

Grey-Rock Industro-Truck is a good lining, especially engineered to stand the gaff of heavy duty. We could give you dozens of good reasons for its superior performance and economy—perhaps even convince you right here and now that you should use it. But we'd much rather that you made the lining prove itself, on its own merits, in competition with other linings. Then we will feel that you know what it can do and will be using Grey-Rock for a long, long time. That's how we got most of our customers—among whom are hundreds of America's largest, most successful fleet operators.

We'll be glad to give you any assistance possible in conducting such a test, by making suggestions on keeping records, making inspections, etc. Write to us.

## DETAILS but not mere details

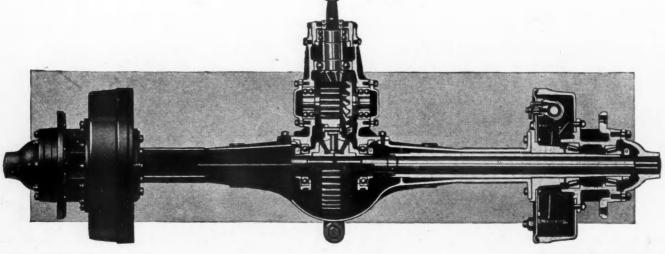

Details account for the sturdiness of Wisconsin Axles—for their ability to deliver thousands and thousands of trouble-free, profitable ton-miles.

They are details of design, which result from years of successful manufacturing experience. They are production details; and inspection details; scores of details, in fact... summed up in satisfactory performance which makes more and more users of trucks and buses rely on Wisconsin Axles.

### AIR BRAKES

Crowded highways, jumbled city traffic, unprecedented speed of today's super transport vehicles, modern standards of economic transportation ... All have contributed to the never equalled popularity of the sure, quick, effortless action of the power brake. Never before has the demand for Bendix-Westinghouse Automotive Air Brakes been so pronounced. As evidence of the trend prominent commercial fleet operators everywhere have standardized on Bendix-Westinghouse

Brake Control. They have learned the economy of a perfect stopping force and, when purchasing new units, are rigidly specifying Bendix-Westinghouse equipment in those few instances where the system is not standard. The trend is permanent and its growth apparent with the future evolution of the heavy duty vehicle. Today's Bendix-Westinghouse Automotive Air Brake offers a perfect balance for modern speed and power with a wide margin of reserve for tomorrow's development. The remarkable effectiveness of the Bendix-Westinghouse Brake is not an accident but, rather, the result of sixty-one years' deliberate research, development and manufacture of power braking equipment . . . the recognized safety standard of the world.

The heart of the Air Brake, this sturdy compressor easily becomes a part of any power plant. Tucked away under the hood, it furnishes a-never-failing air supply for buair horus and other miscellaneous pneumatic devices.

## Topping a Remarkable Record!

NLIMAXING International Harvester's record\* of extraordinary growth and progress, comes the introduction of four new 6-cylinder Speed Trucks . . . 1½, 2, and 3-ton capacities. All have the same slim, sleek, speedy appearance, which is so much in demand today. And beneath their handsome exteriors are features of design and construction which contribute to improved performance and operating economy.

In these new models, sound engineering, extensive manufacturing facilities, and highly skilled workmen combine to advance the high standards set by other International Trucks.

The requirements of various classes of service are taken care of with a wide choice of wheelbase lengths, providing for the use of van, stake, panel, bus, dump, and tank bodies.

International Harvester branches and dealers now have these new Speed Trucks on display. Visit the nearest showroom and see for yourself the features of each model. A convincing demonstration will be arranged on request.

Tires—tires—trucks with four tires—six-wheelers with 10 tires—tractor-trailer units with 14, 18 and 20 tires—trailer trains with 22 and more tires. Everywhere the dependence of the nation on trucks and of trucks on tire equipment is evident. Tires represent an investment by operators running into millions of dollars annually, an investment so costly that it should be protected. Ordinary wear, of course, runs into a pretty penny, but many forms of neglect and abuse easily double the amount. This doubling is avoidable. How? Read the article starting on page 18. It contains everything you need to know about tire care.

# SHOP SPECTATORS— Pest or Pleasure

By GEORGE T. HOOK

Some Shops Welcome the Presence of the Customer But Most Admit It Demoralizes Employee Efficiency

"###-\*\*3/4.3/4//XX@@///&% %\$##()\*\*@@//!!"

UST pause a moment and translate those signs into the longest and most scorching string of cuss words that have ever saluted your ears. No matter how proficient you are as a translator, the fruit of your effort will give you only a faint idea of the salvo of profanity I walked into the other day when I dropped in at a local truck dealer's service shop on one of my periodical visits. The brimstone was belching from the mouth of one of my mechanic friends, and he kept up the stream for so long that I thought he was engaged in a new kind of endurance contest. At last the flow ceased. and I approached the mechanic and asked him pleasantly what occasioned the flattering eulogy. He was about to let go another torrent of invective when a colleague broke in:

"That hymn of hate that Bill sings so expertly is one that the rest of us would join him in if we only knew the words as Bill knows them. We're all pretty darn sore the way customers come in here, snoop around, stick their noses into places where we can only put wrenches, give advice that's an insult even to an apprentice, and annoy us with questions about this, that and the other thing. Bill just had a pretty bad one hanging over his shoulder for about an hour and when you walked in Bill was just letting off steam. A couple times the customer got so snotty I expected to witness a hammer murder."

"Well," I said, after some of the other boys had pitched in their views and Bill

had decided to observe the "Be a Gentleman" notice pasted over the work-bench, "it seems to me that somebody around here is just plain

#### They're a Pleasure and Should Be Allowed in the Shop Because

 It wouldn't pay to offend them.
 You can't let them think you are hiding anything from them.

3. The open shop for the customer inspires him with confidence in the workmen, the equipment and the quality of the job.

The average commercial car owner can be trusted not to allow the shop work to worry him. Sometimes his knowledge of his vehicle is even a great help.

5. Their presence has no effect on mechanics who know their work.

6. Mechanics often make contacts with drivers that lead to business.

#### They're a Pest and Should Be Kept Out of the Shop Because

 They take up the time of the mechanic and thereby increase the charge for service work.

Some mechanics can't do their best work when being watched.

a. Customer-spectators cannot as a rule understand the charges made at flat rate on repairs which are quickly dispatched because of skilled workmen and highly modern machinery and tools. Witnessing such efficiency they are apt to object to the amount of the bill.

object to the amount of the bill.

Of the psychological effect upon the customer-spectator himself. Just as it is better for an ill patient not to know too much about his condition and exactly what variety of treatment he gets in the operating room, so it is better for the truckman not to see his vehicle when it is dismantled and undergoing repairs. It upsets his ideas of the capabilities of the truck unless he is a really experienced mechanic.

#### Shop Spectators Can Be Kept Out By

 Setting the service department apart from the rest of the business. Not in another part of the city but on the second floor or third floor, for instance, or even on the first floor, but so separated by partitions and entrances that the customer is faced with barriers which inoffensively speak the intention of the management.

By adhering strictly to a plainly indicated "No Admittance" policy, and making only such exceptions as are unavoidable and then placing the customer in the charge of an escort. If reasons are requested by a customer, arguments 1 and 2 immediately above may be quoted together with an explanation that exclusion of all visitors contributes to the efficiency of the shop.

dumb. All you've got to do is keep the customers out and you'll have no annovances."

"And that," said Bill with a sneer which I well deserved, "proves you're not so smart yourself. Just how, Brilliant Big Boy, would you keep the customer out? Would you take him by the coat collar and the seat of his pants and give him the bum's rush? Maybe you'd tell him we're busy cogitating and don't want to be disturbed? My eye! Or maybe you'd get down on your bended knee and with tears in your eyes say, 'Oh, Mr. Swanson, I pray you not to darken the door of yon service department. I know it's your truck that is to be repaired, but our dear mechanics just can't work when there's anyone around watching them. Oh, please, Mr. Swanson, help me keep peace in our happy little family circle.' Boloney!"

"Well," I admitted after little or no thought, "it does seem to be a problem now that I've got your slant on it. But do you mean to tell me that every shop is putting up with the same annoyance; that nobody is doing anything about it?"

"Search me," was Bill's invitation.
"I only know that I've yet to work in a shop where a truck driver or truck owner didn't have the privilege of treatin' me like a trained seal. They think it's part of my job to do my stuff while they look on amused or amazed, as the case may be. And

every now and then they throw me a bad fish in the form of advice. I've always thought the life of a sideshow freak was pretty IS MONEY SUNK IN EXTENSIVE

# ALTERATIONS JUST MONEY SUNK?

THERE Was a Time When Almost Any Amount of Truck Design Changes Made in the Field Were Profitable, But Not in This Day of Rapid Engineering Progress, Says Salesman With 20 Years' Experience, Who Points Out the Advisability of Quick Depreciation and the Wisdom of Purchasing New Equipment

O the shop foreman, to the truck owner, to the sales agent, to the designing engineer, to the manufacturer, and to all others who are interested in the economical and profitable handling of commercial cars—Gentlemen:

The subject of alteration has never, to the best of my knowledge, been discussed in this publication. One good reason may have been that progress in truck design was not as rapid formerly as today and therefore there was no occasion to call the attention of the industry to such facts as I propose to present.

My purpose in expressing myself here is to show that if in this present progressive period a truck owner indulges in extensive and expensive alterations to put off the purchase of a new truck he may be setting up a Frankenstein that may devour not only an investment sufficient for the purchase of a new piece of equipment, but also his profits and even himself if he happens to be in a business in which the truck is his means of earning a livelihood. So let's be getting along.

To become of less worth—that's to depreciate.

The amount written off for such loss in value is called depreciation.

To cause to become different—that's alteration.

Depreciation is never idle because it is continuously taking away or adding something; taking away profits and value or adding grief to financial difficulties.

Alteration is less active and comes into play by command.

However well planned, alteration frequently amounts to so much depreciation, and if alteration expenditures are not cau-

tiously made, then loss occurs. Into such a pitfall of extravagance I wish to prevent your falling. Only a fair amount of brain power is necessary to observe the dividing line between profitable and unprofitable alteration, and the man or company not familiar with the demarcation is either headed for bankruptcy or losses in varying degrees which otherwise might be totally or partially avoided. The following true story of alterations is offered to aid you in seeing more clearly the line dividing profit and loss.

In the year 1926 a popular, four-cylinder, 21/2-ton, gas-lighted, solid-tired handshaker was bought for \$4,000. In the course of time it developed that on rainy mornings this truck was half an hour behind schedule for no better reason than that the driver was compelled to battle with curtains before starting on his route, plus added inconvenience of unfastening and fastening again at stops. The foreman, awake to the situation, knew full well it was useless to even suggest to a drowsy driver that he ought to report half an hour earlier on rainy mornings. What did he do? He did the only sensible thing. He ordered a closed cab and had the fresh-air rattler taken off. The cab was installed, the cash outlay running over \$200. What actually became of the \$200? Hold it in your mind's eye; we'll recall it further on.

In 1927, due to changes of load to be carried, a longer body was purchased, which brought about the necessity of lengthening the frame to accommodate the change. This done, a frame sag de-

DISCUSSION BY

Truck Salesman for 20 Years

veloped which was overcome with fishplates. The amount spent on the frame was \$250. Hold this in your mind's eye for further reference. (The body is a separate account.)

In 1928 motor vehicle legislation called for a stricter observance of the 15 miles per hour allowed for solid tire equipment and an increase of 5 miles' speed for pneumatic-equipped trucks, making 40 m.p.h. the going highway speed for traffic. The foreman, again confronted with the problem of time and schedules, sought counsel, and a change-over to pneumatic tires was ordered. Wheels and rubber with spare tire, tire carrier, jack and lug wrench were placed on the job. Amount spent—\$1,000. What became of the \$1,000? Hold this, too, for further reference.

After changing the tires and altering the frame, it was decided the four-cylinder engine was not equal to the job. Though no more actual load was hauled, she was slow on the road. Plank down \$1,250 for a sweet-running, snappy six-cylinder truck engine to keep up with traffic.

Then sad but true the sound of the exhaust had hardly become familiar to the driver before the shortening days of fall reminded him of difficulties with poor lights in the early morning, and moreover a starter ought to help out considerably. No cause for worry; just put down another \$300. (The money rolls in and out because it's round and while it's rolling difficulties fade away.)

By the latter part of 1928, fully convinced that a different steering gear was needed to turn the pneumatic tires on the front, the foreman asked for one and it was put in. Another nick in the saw — \$100, please!

I hope you don't laugh too loud when I tell you two-wheel brakes are the bunk with a four-wheel speed of 40 m.p.h. You have surely sensed the need and jotted down the \$100 for the booster to help us quit going at the right place.

Ugh - ugh! \$3,200 tied up in changes—seven of them in four years, and all of them alteration, according to our definition, because not drawn in the original design. Overhauls, paint jobs and service have been omitted purposely, also loss of time in the shop to make these changes and touch up the paint after changes were made, which would add some of the pennies and days we spoke of leaving out.

#### • Two in One •

DUT let me tell you now—this job at the end of four years lacks many refinements found in present production. The \$3,200 spent is an average of \$800 a year for alteration. The same rate continued one more year would make exactly \$4,000—the original cost of the job. Imagine it if you can, and I know you can—the price of two good trucks in one, and that one an old one, in a five-year period.

This is one make and one model, and our investigation proves that many others went through a similar process, and even many other jobs, such as bus-type front axle change-over for shorter turning; six wheels and the third axle attachment, and speedometer changes, and many others to offset rubber change-overs.

Let us depart for a moment to the used-truck market and inquire the sale price of the original model with which our story is concerned. This in most cases answers the trade in on new stuff. We are told from \$1,200 to \$1,500, according to appraisement. Mention of alterations brings an answer slightly higher—\$1,500 to \$1,700, the pneumatic tires causing the difference.

Tell me, if you can after recalling the tab from your mind's eye, what became of the \$3,200?

Depreciation is a bitter pill but the penalty for alteration is even worse when you consider how little of it can Turn to page 52. Places

## CORRECT TIGHT CORRECT VALVES ALIGNMENT PROPER HEEL CAREFUL ABRASIVE PROBLE BRAKING REMOVALS RIGHT SPOT LOADING SIZE REPAIRS REGULAR INSPECT/9 CORRECT INFLATION VULCANIZATI

# FOR MILEAGE HEALTH

VERY year loss of millions of miles of tire life, not to mention delivery interruptions totaling thousands of hours, are caused by tire neglect. This great economical loss is preventable and entirely unnecessary. A truck tire probably gets more abuse and less attention than any other article in general use and yet is very responsive to care. The old adage, "a stitch in time saves nine," is particularly applicable to the tire and clearly indicates the way to maximum tire mile-

Tire care, of course, is the answer for attainment of healthy mileage. This fact is generally recognized, but strangely very few operators actually do anything about it. For some inexplicable reason the tire is treated like a stepchild and, worse still, frequently does not receive the ordinary care that even a stepchild deserves. Perhaps the explanation for this attitude lies in the fact that the penalty of tire neglect is not immediate. Because a tire continues to perform although overloaded, under-inflated or cut to the breaker strip, the need of reducing the load, properly inflating the tires or promptly repairing a minor cut is not recognized as urgent. As a result care either is not given at all or postponed indefinitely.

Tires need attention and nursing. They need it perhaps more than any other single unit making up a truck chassis. Absence of this care results in abuse and the abuse in injuries,

Regular Inspection, Preventive
Maintenance and Considerate
Treatment Result in Many Additional Miles of Profitable Use

By MARTIN J. KOITZSCH

which forgotten, accumulate until suddenly, like the "deacon's one-hoss shay," the tire collapses beyond redemption after serving only a fraction of its potential life.

The penalty of improper tire service is surprisingly severe and is dealt in two ways: directly and indirectly. Directly from premature failure of tires, which lessens the average tire mileage, necessitates frequent replacements and, of course, increases operating expense. Indirectly, and this may be as great if not greater than directly, through time-losing delivery interruptions caused by flats. Here's an example of how the penalty may be exacted: The inside tire of a dual wheel goes flat while the truck is on the What happens? The flat entails the expense of change involving service, equipment, time and labor; it means tire repair cost; it involves possible damage to outer tire before flat is detected; it incurs loss of the use of the vehicle during the change; and finally, and not of least importance, the delay may disgruntle the customer and adversely affect the good name of the company depending on the truck. While it is obvious that the direct penalty of many delays is costly, the cost of indirect penalty is not so obvious and, it should be remembered, expense of this character is not computed in the tire cost per truck mile.

#### Nursing Ritual

HERE are three things an operator can do to get maximum mileage from his tires. First, equip the truck with tires of the proper size;

second, instruct drivers to exercise care while driving to favor the tire; third, arrange to have the tires regularly and properly serviced.

Since tire performance depends to a great extent on the load which it carries, obviously it is wise to determine accurately the loads to be carried on each load. Failure to do so may result in overloading. Loading a tire beyond its rated capacity may cause over-stressing by heavy inflation or excessive flexing of the side walls and distortion of the tread. Sooner or later this misuse results in broken fabric, rapid and spotty tread wear, tread and ply separation and finally in complete failure of the tire.

The most satisfactory method of determining what size tire is correct is to actually weigh first the front wheels and then the rear wheels of a vehicle, checking the sum of these weights against the weight of the entire vehicle. In some cases it may not be possible to weigh the unit fully loaded. In such instances distribution of pay-load can be approximately determined by adding the pay-load per axle to the empty weight of the truck front and rear. In this manner the approximate total load by axle is obtained. This weight by axle can then be divided by the number of tires on each axle to determine load on each tire. Method of computing the pay-load is as follows: A-Distance from front hub to center of pay-load.

B—Distance from rear hub to center of body.

C-Distance from hub to hub.

Measurements must be taken in inches. Apply the following formula to obtain percentage of pay-load on front and rear axles:

$$\frac{B \times 100}{C} = \text{Per cent of load on front axle.}$$

$$\frac{A \times 100}{C} = \text{Per cent of load on rear axle.}$$

Driver Care

O matter how much care is taken to fit the right tire to the load or how excellent the servicing facilities at the garage much of the good derived from these excellent provisions is lost unless the driver can be encouraged to add his bit by proper treatment of the tire while on the road. Once convinced of the importance of avoiding certain abuses the driver can help definitely in the nursing by:

Not jamming tires against curbs or into chuck holes.

Avoiding scraping contacts against curbs and jutting obstructions.

Accelerating and slowing down without spinning and locking

Attending to underinflated tires promptly.

Replacing valve caps after inflation and keeping them clean.

Not attaching anti-skid chains too tight.

Removing immediately obstacles wedged between dual tires.

Refusing to operate on a flat. Beware the careless driver whose tires are over-inflated at one time and under-inflated at another, who constantly drives at excessive speeds on the open road and cares little for the abrasion, slipping and spinning caused by going over avoidable rough roads, who uses his four-wheel brakes to the limit and leaves tire marks representing hundreds of miles of rubber on the road, who jams the accelerator to the floor and jumps the vehicle away at the start, takes turns at high rates of speed, who applies anti-skid chains too tight, causing tread to be gouged by cross-links and who ruins tires and tubes by running Dispensary Program

HE third step in tire preservation is proper service. When considering this final phase the question might be "Who is going to furnish this service?" Can it be handled economically by the operator himself, should he get it from an organized tire service station, or should he avail himself of both? The answer will vary with the circumstances, but the main thing is that somebody should do it. Irrespective of who does it, a discussion of what such service should comprise is more to the point at the moment. Proper tire service provides first the regular checking of inflation pressures; second, inspection of tire condition; and third, prompt correction of defect. That the duties of tire service are many and important is quickly reflected by the following impressive list of things to be borne in mind:

Proper inflation, leaky valves, tight rims, rim bruises, deep cuts, small cuts, tread wear, wheel wobble, misalignment, faulty brakes, removal of abrasives, spot repairs, sectional repairs, etc.

The chief factor in the life of any pneumatic tire is the air contained within the tube. Contrary to general opinion it is the air that carries the load and not the carcass. The carcass is merely a container for the air. The amount of air must always be sufficient to carry the load and permit the tire to perform its natural function, otherwise the tire will fail from flexing brakes, excessive tread wear, carcass rupture, tread separation, rim cuts and rim bruises.

Pressures should not be guessed at when inflating tires, but should be based on pressure charts furnished by all tire makers. Balloon tires are especially vulnerable to improper pressures and should at all times be kept inflated within one pound of the recommended pressure. If high-pressure tires are checked only once a week they should be inflated 10 per cent above the recommended pressure. Should regular inspections reveal a certain tire to be persistantly low, the cause should immediately be sought and corrected. Loss of pressure may be through the valve base, valve core, because of a dirty valve, leaky tube, etc. The alert inspector will also tighten nuts on valve at the base and valve cores occasionally. He will always apply valve caps and screw them tightly as they aid in retaining air and prevent dust and mud from getting into the valve and under the valve seat. He will also see that the lock nut on the valve stem is screwed down tight to prevent a tube from being ruined when a tire goes flat by the valve being pulled inside the casing. Care should be exercised in mounting dual disk wheels to make sure that hand holes line up to admit of ready inflation from the front.

#### Rim Ailments

RIMS often play an important part in the mileages of tires. Bent and rusty rims often prove expensive. When a flange has a bent spot the bead of the tire is not properly supported and air pressure from within causes a bulge in the tire. This bulge causes chafing of the bead covering whenever this portion of the tire comes in contact with the road, ultimately weakening the bead and causing tire failure. Generally it is possible to straighten rim flanges with a hammer, but if rims are in such a bad condition that they cannot be fixed they should be replaced with new ones. Rusty rims cause damage to beads and should be cleaned at each demounting to prevent erosion and rust accumulation. Old rims should be buffed and painted with aluminum or graphite paint before new tires are applied. Such care reduces another form of bead chafing and eventual rim cuts and the chance of tires freezing to the rim with consequent need of excessive and injurious force in mounting and demounting. Studs or lugs should be tight. Loose lugs not only induce elongation of stud holes, promoting uneven tire wear, but bring with it all the other dangers of a loose rim. Use of standard rims with oversize tires is not uncommon and is a practice that cuts into tire life. The narrow width of such rims cause the beads to be drawn closer together than normal with the result that only the heel of the bead contacts the rim face and flexing at the side wall occurs at a point not designed to assume this function.

Care should be exercised when using oversize dual tires on standard rims that sufficient spacing is provided between tires. Insufficient spacing allows dual tires to rub on the inside, causing loose tread at shoulders, changing flexing and, of course, premature failure.

Split rims improperly joined because of battered condition cause injurious chafing of bead. When locked, TURN TO PAGE 50, PLEASE

### TIRES NEED NURSING FOR MILEAGE HEALTH

## JULY AND AUGUST GIVE TRUCK INDUSTRY SMACK

#### SALES DROP MOUNTS GRADUAL-LY IN FIRST EIGHT MONTHS

OMESTIC truck sales in the first eight months of 1930 were 19 per cent under the total for the same period of 1929. Foreign truck sales for the same eight months of 1930 were 36.6 per cent under last year's figure. Total foreign and domestic sales were 26.2 per cent less.

And there you have an easily digested paragraph anent the state of the truck business at this very moment. It is not a pleasant pill but there should be some relief in the knowledge that other industries have swallowed more bitter ones since last October.

Just glance over the percentages in Table 1 on this page. The table tells an interesting story. It reveals the gradual effect the depression in business generally has had on the truck industry, from a slight gain in January to the low water mark in August. It had to happen just as the figures show it did happen because the truck, being a business accessory, is affected in direct proportion to general business. This observation may be elementary but it is important and should be borne in mind when viewing the future. For instance, if the truck industry should be content to let economics take a natural course its rise to so-called normalcy might be just as gradual and protracted as its descent. However, at the first sign of a business upswing the trade might readily accelerate its own prosperity by assuming the initiative with intensive sales effort. After all there is no better time to talk economical transportation to a business man than when he is experiencing a business pickup and is battling with competitors for advantages.

Table 2 tells quite another story—the effect of the business recession on the earnings of companies interested in the lucrative truck market. No comment is necessary beyond the explanations that the companies listed are the only ones whose statements were available, that their truck sales were 43 per cent of the total for the first six months of this year, and the bulk of the deficit incurred by each combination passenger car and truck manufacturer can indubitably be laid on the running boards of the passenger car.

#### TABLE I

| Domestic | Truck    | Sales   | 0/ 0-:-        |

# WHAT HOLDS THE

#### **EDITOR'S NOTE**

This, the second of a series of articles explaining the whys and wherefores of various designs incorporated in major units of trucks, is devoted to rear axle construction. Features which distinguish semi-floating, three - quarter - floating, full - floating and dead axles are shown and explained

By ATHEL F. DENHAM

# REAR WHEELS ON?

Two Wheel Bearings in Full Floating; Drive Shaft in Semi-Floating; and One Bearing and Axle Shaft in Three-Quarter Floating Type Axles

ELL, a couple of hours later we got back to our swivel chair, and there was Mac, still waiting for us, and evidently hugely enjoying our pet box of Manila Ropa Perfectos, which he had discovered in the bottom drawer of our desk. We salvaged the one remaining cigar and to get the matter over quickly, said: "Well, Mac, sorry to keep you waiting, but what was that other question you were going to ask me about trucks?"

Mac grins. "You old egg," he says, "I know you tried to duck me, but I'm not going to let you get away with it. What I want to know is: what is the difference between all these truck axles? Some of the jobs these follows have been trying to sell me, they say, have semi-floating axles, some say theirs have full floating axles, and some split it at three-quarters. What difference does it make?"

"Ivory soap," we say, and when Mac looks inquiringly at our editorial countenance, we proceed to elucidate: "It floats. Moreover it is claimed to be 99 44/100 per cent pure. Aside from that it has nothing to do with the case. If you could get rid of Mrs. MacAndrews, your esteemed mother-in-law, and your farm, we might call you full-floating-or as Webster has it: free from the usual attachments. If you couldn't dispose of the farm, but Mrs. Mac and her mother would go away on a prolonged vacation, we might call you three-quarter floating. If Mrs. Mac stayed behind, semi-floating would be the best we could do for you."

"Well, that would help a lot," Mac reflects. "I think though that if they all stick by me I would finally become a dead Axel, if I were Swedish." "Absolutely and scientifically correct," we reply, much to Mac's surprise, "except that in your case you would only be good fertilizer, whereas in a truck a dead axle is highly esteemed by manufacturers of some of the big trucks, in that it provides all the support for the truck, which is more than you could do unless you pay up your insurance premiums."

"Wait a minute," says Mac, "this is all very illuminating, but my original question was serious."

(Isn't it funny? You explain something to a fellow like Mac and when you get all through he thinks you have been discussing the weather. Is it the heat or just the stupidity?)

"All right, let's start over again," we recommence. "In the first place a rear axle has three jobs. It provides spindles or bearings about which the rear wheels revolve; transmits the power or driving torque to the wheels, and supports the truck. In most cases the axle shaft takes care of the job of making the wheels go around. The other two jobs are handled, however, in all kinds of different ways. In some of the heaviest trucks, as I tried already to explain to you, a separate 'dead' axle is used, to which the wheels, springs, radius rods, etc., are attached. When these dead axles are used, the drive is taken through gears at the wheels, or by chains.

"But more often than not, we continue, "one axle is used to do all three jobs. This applies to almost all passenger cars built at present in these United States, with the exception of the front drives, which have separate axles to carry the wheels and trans-

# that the first thought of an assemblyman or senator upon being elected to the legislature is to knock off from his plumbing, his pants pressing or his garboon burnishing and devote a few thoughtless hours to composing a piece of legislation aimed at the automotive indus-

AFTER HOURS

posing a piece of legislation aimed at the automotive industry. And the big point is that their thoughts aren't chiefly directed at passenger cars because such legislation would doubtless affect them directly. When the desire to throw vitriol comes over legislators their first objective is the motor truck and their second the motor bus. It used to be that the railroads were given preference, but not

Legislation against the motor truck ranges from the ludicrous to the pernicious. Illustrating the former is the bill that sought to compel trucks to carry sand boxes for use on grades in wet or sleety weather. Typical of the latter is the measure that wanted every man or similarly inclosed truck body to carry a helper whose duty it would be to keep a lookout when the driver was backing up.

any more.

It is all a good laugh with tragic consequences always just around the corner. Obviously the industry must be prepared and alertly defensive. The truck trade and truck users must be organized in each commonwealth to ward off the blows before they produce tears.

If you are interested in the legislation passed by other states this year, the following summary will take up only a few more minutes of your time:

South Carolina increased the gross weight of trucks to 12½ tons for single units, or 20 tons gross on combinations of units. Maximum height was increased

to 121/2 ft. and maximum length to 33 ft. Both Virginia and South Carolina enacted new laws affecting common carrier operation. The Virginia law reclassifies trucks so that apparently if the law is strictly enforced the contract carrier will be entirely eliminated from the highway. The law has not yet been tested. In South Carolina contract carriers now must secure certificates of convenience and necessity just as common carriers do. South Carolina also enacted a law requiring the licensing of all drivers. Applicants passing examination will receive licenses good until 1933, after which time licenses will be renewed for a four-year period.

New York and Massachusetts passed laws specifically permitting six-wheel trucks under certain conditions and increasing the maximum load allowed on these trucks. The New York law specifies 42,000 lb. gross on pneumatic tires, and 36,000 lb. on solids. Operation of the sixwheelers is restricted to certain highways to be designated by the highway commission. Massachusetts limited the gross weight of six-wheelers to 40,000 lb. and did not differentiate between pneumatics and solids. Operation is permissible only over "through highways." New York paid some attention to trailers also. The law provides that trailers of over 3000 lb. gross placed in operation on or after Oct. 1, 1930, must be equipped with brakes. Also that all trailers shall be so attached to the tractive units that their wheel tracks shall not vary more than 6 in, from the wheel tracks of the tractive units.

In that batch your judgment is as good as ours in sorting the good from the bad.—G.T.H.

#### 1400 LEGISLATORS EQUAL 1400 BILLS

BILLBOARD advertisement of a popular cigarette cries "In women—it's charm; in tennis—it's stamina; in racing—it's speed." To all this we add one of our own: "In state legislatures—it's sock the automotive industry!"

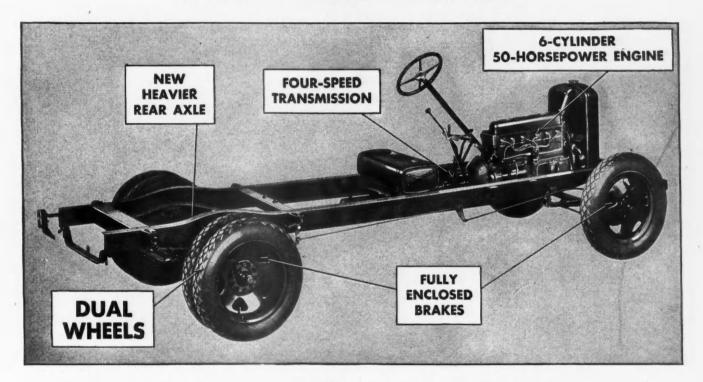

This paraphrase occurred to us with practically no thought after perusing a report that nine state legislatures held sessions this year at which 15,000 bills were introduced, approximately 1400 of which affected the automotive industry. And the 1400 does not include measures dealing with highways.

Now when you know that the number of legislators representing these nine legislatures was in the vicinity of 1400, it's simple arithmetic to figure that automotive bills introduced averaged one per member. If that isn't unwholesome popularity then we don't deserve any appreciation for the trouble we have taken in presenting these interesting statistics. It seems

# Chevrolet A NEW 6-cylinder Truck

### with Dual Wheels

To those thousands of business organizations who want a big, rugged, powerful truck of unexcelled economy—Chevrolet has this important message: A new six-cylinder 11/2-ton Chevrolet truck-with dual wheels-is now ready for service!

In everything that makes a truck more useful—

more profitable-and more desirable in modern business-this new Chevrolet excels. It offers advantages in performance, in dependability, in economy and in good looks that are new to the low-price commercial car field!

Of special importance in many types of heavy-duty hauling is the new dual wheel equipment-of sturdy web-type design. This equipment is now available at slight extra cost, and includes six truck-type cord tires.

Another valuable feature is the new rear axlebigger, heavier, more durable. Still others are the unusually large and completely enclosed brakesthe double-steel channel frame—the four-speed transmission. And Chevrolet's now-famous 50-

> horsepower valve-in-head six-cylinder engine provides the smooth, flexible, powerful, economical performance that modern trucking conditions demand.

> If you are interested in buying a low-priced truck, there is all the more reason-today-why it's wise to choose a six-cylinder Chevrolet. Your nearest Chevrolet dealer will be glad to give you a trial load demonstration any time.

# TEARING THE MASK FROM OIL THIEVES

S it possible for an engine crankcase to be robbed of oil secretly, like a store till by an erring clerk?" George Hook, editor, looked up from a letter he was reading and turned to the technical editor on his staff for a reply.

"Yes, sir. Yes, indeed. In cases of oil pumping and those stages of excessive oil consumption that lead up to fouled plugs and other troubles, quarts and quarts of oil poured into the crankcase simply disappear," I answered.

"Are there no clues?"

"There are clues, not too plain in some cases, but there are some clues in all cases."

"How many causes of oil pumping are there, and how can a mechanic tell one from the other?"

A panorama of varied scenes, without plot or sequence, passed through my mind before I replied. Worried service managers—, truck owners making pointed inquiries—, fancy pistons—, trick rings—, cylinder honing—, heavier oil—, mystery—, detection.

"Four leaders dominate the gang of oil thieves, but each of them wears many disguises and has several followers. First on the list—, but let me know just what the owner's trouble is."

"A fleet owner writes me asking why his truck uses so much oil. He is having trouble with spark plugs. As he is only one of many who have written to us, why not make the answer complete and give it to our readers

An Expose in Which Causes of Excessive Consumption Are Collared and Taken for a Ride

GUMSHOE WORK BY

JAMES W. COTTRELL

to help them track down oil thieves who are reaching their pocketbooks via engine oil?"

Here is the answer:

First on the list of suspects are piston rings, then follow pistons, next cylinders and finally, the oil itself.

Rings may be worn on the face until they have no tension, stuck in grooves from heat and/or carbon, be loose up and down in grooves, scored from running dry, or unsuited to the engine in which they are used.

Pistons may be scored, have too much clearance, be out of round, mounted on bent connecting rods or be unsuited to the engine and service in which they are used.

Cylinders may be tapered, out of round, scored, distort under heat or be out of alignment with crankshaft.

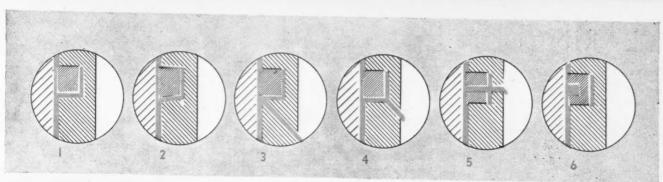

Oil causes its own loss when too much is thrown on cylinder walls by loose bearings in a pressure-lubricated engine, when it is diluted by light ends of fuel and finally when the oil used is too thin, even when fresh, for the engine.

The two most common remedies for oil pumping are to change to a heavier grade of oil and to install new piston rings. While these remedies frequently are effective, it by no means follows that they are the correct remedies.

Changing to a heavier grade of oil is strongly condemned by several prominent manufacturers. As one of them expresses it: "Heavy oil when first used may cause a decrease in engine oil consumption—, but its continued use will tend to gum and stick the compression and oil rings in their respective grooves,

At right—How oil leaks are controlled by rings. Fig. 1—Oil by-passing worn rings; Fig. 2—Ring and groove worn on top and bottom; Fig. 3—Chamfer and oil drain; Fig. 4—Oil drain from groove; Fig. 5—Ventilating slot in ring opening into drain groove, and Fig. 6—Groove ring face

The Commercial Car Journal and Operation & Maintenance

September, 1930

and this condition will materially increase oil consumption."

Increase in oil consumption usually comes on gradually. A filling of the crankcase will serve the engine until it is time to drain and refill with fresh oil. After a time the owner notices that it is necessary to add a little oil to keep up the level until the draining. After a few more thousand miles of travel he finds that it may take a quart or two. This continues until he is adding oil almost every time gasoline is put in the tank. In the final stage the oil reaches the combustion chamber in such quantities that plugs start to foul every few days, and in extreme cases every few hours. By this time the condition is serious because it interferes with operation of the truck in addition to costing money.

Granting that the oil is known to be of good quality and adopted to the engine in question, and the service in which the truck is operated, service men look to the piston rings as the culprits responsible for loss of oil.

It is high time that something good was said about piston rings. They have been cussed too much, unjustly accused and thrown out for no fault so often that "there ought to be a law

Scored cylinders will pump oil in spite of the best efforts of well-fitted rings. Loose connecting rod bearings may throw off so much oil that rings, otherwise satisfactory, cannot handle the deluge. During a long trip down hill in gear with the truck driving the engine there is a partial vacuum in a cylinder most of the time, and this draws oil into the combustion chamber.

A piston ring has plenty to do. It sweeps over an area equal to city building lot, 25 by 100 ft., every minute and maintains a film of oil on all of that surface. Pressure on the ring varies from 300 lb. per sq. in. to a partial vacuum, temperature ranges from below zero to 300 deg. or more. Any well-behaved oil ring deserves a

oil?" The first place to look for loss of oil is outside the engine. Little pools of oil under a truck each morning show that oil is leaking out. If the oil pan is wet on the outside we suspect the oil pan gasket. If there is more oil on the front of the pan than at the rear we have misgivings about the timing gear cover gasket. Oil coming down the rear end of the pan and the forward face of the flywheel housing reveals that oil is getting out of the rear main bearing. A positive check for this latter condition is the oil-pressure test described last month.

There is nothing very mysterious about these losses of oil. The cause is apparent. But when oil disappears inside an engine without leaving any outward trace, service men are puzzled,

sometimes baffled.

Bad cases of oil pumping call for taking off cylinder heads and removal of connecting rod and piston assemblies. This labor is not lost because a carbon and valve job usually is in order anyway. With the engine opened up to this extent it is easy

to make a thorough examination and track down the cause of loss of oil.

Ordinary wear of the face of rings is frequently overlooked. On examination the ring face shows a dull silver color all around indicating that it is contacting the cylinder walls properly. But all of the life is gone from the ring. Compressed until the gap is closed, it is slow in snapping open again. Rings in this condition usually show signs of wear on top surfaces as well. Measure width and thickness of ring to settle this ques-

Up and down play of a ring in a groove provides a valve action which makes an excellent pump. On down stroke of piston the ring is at top of the groove and oil is forced under bottom edge of ring and into space behind it, as shown in Fig. 1. Because top surface of the ring does not fit perfectly against top of the groove, some of this oil is squirted on the cylinder wall, thus by-passing the ring. At bottom dead center the ring moves to bottom of groove displacing oil to top of groove and so to cylinder walls.

Loss of oil between face of piston ring and cylinder wall is a form of larceny which is hard to detect. Some oil must be left on the cylinder wall for lubrication of piston and rings. But it is difficult to provide just enough oil at all times and not too much at any time. It really takes a lot of force to shear through a film of oil, such as that deposited on a cylinder wall by oil mist in crankcase and spread out by preceding strokes of a piston. There is a tendency for the ring to ride over the film, like a surf board towed behind a fast motorboat. This tendency cannot be overcome entirely but its harmful effects can be reduced.

Space can be provided for the oil, scraped off by the edge of the ring, to This space may be a accumulate. chamfer on the piston below the ring or a groove in the ring itself. Another method of getting rid of the crest of the oil wave ahead of a ring is to cut slots through the ring so that oil can pass behind the ring, as in Fig. 5. There is, of course, no law against combining these methods in various forms such as rings which are both grooved and ventilated, or grooved pistons and ventilated rings,

Pistons, joint workers with rings, are subject to the same failings and a few of their own. Grooves and chamfers are cut to hold oil scraped by rings. But these do not suffice in all cases and it is necessary to drill drain holes in the chamfers and from ring

FROM OIL THIEVES

## UPWARD FLUSHING REDUCES COOLING SYSTEM TROUBLES

Operation Can Be Accomplished Easily With Radiator in Chassis

WHILE the truck cooling system of today is a considerable improvement over the system of a few years ago, the operator must still do his part. The cooling system requires maintenance just like any other part of the truck. Neglect in this department means a higher average per mile haulage cost.

At one time it was almost impossible to keep a truck cooling system clean and tight, but most operators were not duly agitated.

The general practice seems to have been to drive a radiator until it became clogged or broken beyond repair, then junk it in favor of a new one. An absurd and expensive procedure in view of the equipment which has now been developed and with which most radiators can be repaired, cleaned and prepared for service in a very short time and at a comparatively small expense.

An operator doesn't drive a truck until the valves burn off, nor does he neglect the oil until the motor

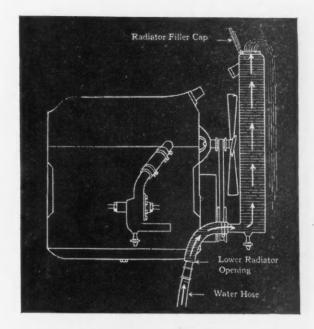

So it should be with the cooling system. Rubber hoses are comparatively short lived in trucking service; high speed water pumps wear packings; road shocks, strain and driving vibrations break radiators; gaskets have a curtailed period of efficiency and water passages accumulate rust and scale which reduce cooling efficiency. Failures in these parts cause loss of solution which, in turn, results in overheated engines, deteriorated lubricating oils, loss of power, possibly expensive hang-ups and most certainly a generally less efficient powerplant.

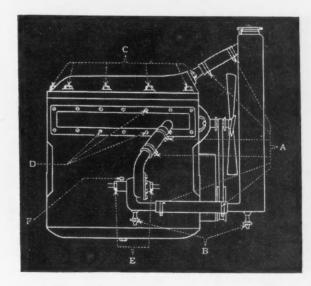

It is neither difficult, time-consuming nor expensive to clean a truck cooling system. All the equipment required is a combined air and water nozzle, a water hose, an air line and a supply of a standard cleaning compound or an alkali such as washing soda. Cleaning procedure is as follows:

Open the lower hose connection and the drain cock (see Fig. 1). This insures rapid and complete drainage. Connect the opened hose and close the drain cock. Place the cleaning compound in the system according to directions given on the container. If soda is used, mix 1/2 lb. to each gallon of water.

Start the engine and with a cover over the radiator to cut off air, run at a medium speed until hot, about 180 deg. Continue for between 20 and 30 minutes. Stop engine.

Disconnect lower hose connection and drain as done originally. Place the air and water nozzle in the opened hose connection and flush the system in a direction opposite to normal flow. Care should be taken

Top-When flushing turn water on gradually Bottom—Showing parts of cooling system that should be tightened. A—hose clamps; B drain cocks; C-cylinder head bolts; D-expansion plate bolts; E—water pump packing;

-grease cups or fittings on water pump

not to build up too high an air pressure in the cooling system or a burst radiator may result. The air jack should be applied to the valve on the nozzle only for a few seconds at a time, just long enough to impulse the water stream.

About 10 min. of this will usually clean out the greater portion of the rust sediment and scale and leave the cooling system clean, as will be indicated by the clearness of the exhaust stream.

## SERVICE TROUBLES SOLVED THIS MONTH

- I. Ring and Valve Wear
- 2. Timing F4 Reo
- 3. Clutch Drag
- 4. Ignition Puzzle

particles of dust will work into any small opening. Worn throttle valve shafts and bearings can admit dust. Even the small quantity of unfiltered air entering a carburetor during idling may carry enough abrasive to cause trouble. Finally dust may work under the valve cover and be drawn down the intake valve guides.

Conditions may call for cleaning the

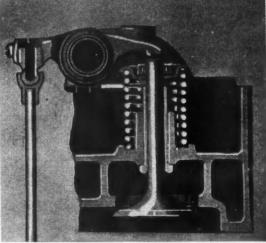

#### 1. RING AND VALVE WEAR

LARGE fleet owner, in a foreign country, is experiencing trouble because of excessive wear of piston rings and short life of intake valves on Reo T6 engines in 3-ton G and GA trucks.

Piston rings wear out in about 5000 to 6000 miles, sometimes less. Intake valves wear up into the heads and show a particularly crooked seat when removed. Seven different makes of piston rings have been used with "practically the same results." Trucks are fitted with Model S Schebler carburetors, which are correctly adjusted, and are equipped with air cleaners. Valve and ignition timing are checked regularly.

 Eliminating possible causes of this trouble, one by one, leaves entrance of dust into the engine as the most likely cause. Ring wear alone might be due to rings themselves. But seven makes give the same results and rings cannot cause wear of intake valve stems, faces and seats. The fact that intake valves are giving trouble and exhaust are not shows that the trouble lies in the intake system. If dust is drawn into an engine through the carburetor or manifold, intake valves and piston rings wear rapidly.

Use of air cleaners is a point against the dust explanation. However, in very dusty sections, fine

air cleaner every 25 or 50 miles instead of at 500-mile intervals, as ordinarily recommended.

Examine the engine oil pan thoroughly and, if necessary, have a sample of oil analyzed just before draining to refill with new oil. If dust is, in fact, being drawn into the engine, traces of it may be found in the engine oil pan. In similar cases dust has been found in depressions of the pan in the form of thin cakes.

## FOR SERVICE MEN

#### 2. TIMING F4 REO

SERVICE station in New York State asks for valve and timing on the four-cylinder Reo Speedwagon.

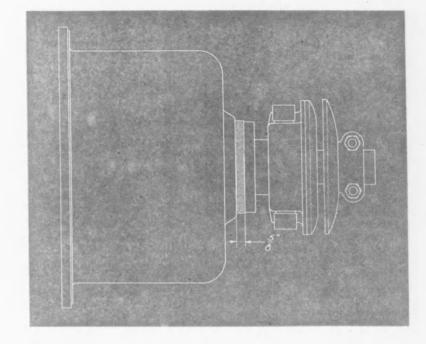

• Flywheel on this engine is entirely exposed and therefore it is quite easy to check valve and ignition timing by flywheel marks. The flywheel is marked U.D.C. 1&4. Breaker points should just start to open, with spark retarded, when this line is opposite center punch mark on rear cylinder block.

Intake valve opens 2½ in., measured on rim of flywheel, after upper dead center, with tappet clearance of .003 in. For convenience, we suggest that clearance be set to .007 in. and timing checked with a .004-in. feeler between valve and tappet. When this feeler is just gripped, the mark 2½ in. from U.D.C. should be opposite center punch mark on cylinder block. After timing be sure to return tappet clearance to .003 in.

#### 3. CLUTCH DRAG

ROM New Jersey comes reports of a clutch which drags so badly that "if you are moving the truck in first or reverse and stop, you can hardly force the shifting handle in neutral." The truck is a 1928 Sterling which is equipped with a multiple-disk

clutch running in oil. Trouble with dragging followed an overhaul of the clutch during which new plates were installed. The mechanic says that the clutch spring is not adjusted too tight, as the adjusting sleeve still has 1¼ in. of thread for further adjustment. Oil in the clutch is a light mineral oil, as specified, and level has been checked against truck manufacturer's recommendation.

• The adjusting sleeve should have about % in. of thread exposed when properly adjusted. If it is out so far that 1¼ in. of thread is shown, the sleeve will strike the clutch throw-out bearing when clutch pedal is fully depressed. As the sleeve probably was screwed out this far in attempting to overcome dragging, it is evident that something else is at fault.

Misalignment of the flywheel housing is the probable cause of this trouble. If housing bolts are allowed to remain loose, both bolts and bolt holes are worn oval and tightening bolts again does not restore alignment.

Check alignment of flywheel, of housing and of clutch with a dial gage. First mount the dial gage on clutch housing and see if flywheel runs true, then mount dial gage on flywheel and see that housing is true within .003 in. Also make sure that clutch is properly mounted in flywheel.

#### 4. IGNITION PUZZLE

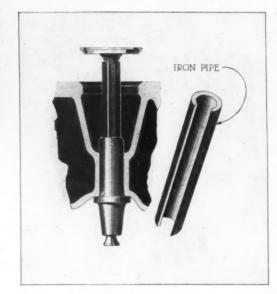

HIRTY minutes or so was about all a certain engine would operate. It started off in fine style on the first trip after a repair job, but went dead in less than an hour. When the trouble shooter arrived he found no spark and towed the job back to the shop. All tests provided by a complete test bench showed coil, distributor and condenser okay. So the ignition system was replaced and the engine ran. But on the next trip it stopped again. Ritual of towing, testing

## SERVICE HINTS FROM SHOP AND FACTORY

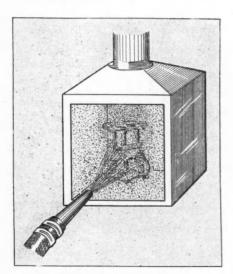

\$5 IDEAS FOR SERVICE HINTS FROM SHOP MEN ARE WELCOME. TELL ALL ABOUT THE IDEA IN SHOP TERMS AND SEND DRAWING OR PHOTO. FIVE DOLLARS WILL BE PAID SUCCESSFUL CONTRIBUTORS.

#### THE HINT OF THE MONTH

Soldering Cast Iron

AST-IRON surfaces cannot be tinned readily, and therefore it is almost impossible to do a satisfactory job of soldering on this metal,

and babbitting of line shaft bearings and other parts is more difficult.

H. W. Swope, Danville, Pa., reports that sand blasting prepares iron for tinning and soldering. It appears to remove carbon from cast iron and leave a smooth, bright and clean surface. Sand blasting also is effective in preparing surfaces for welding. Regular soldering flux is used for jobs on sand-blasted surfaces.

#### Ford Valve Remover

Sticking valve stems in a Model A Ford engine will make a mechanic speak in language ordinarily reserved for balky mules. W. C. Burgan, San Diego, Calif., suggests a way of doing the Job and saving cuss words.

Cut a slot slightly wider than the valve stem in a piece of ½-in. iron pipe, 2½ in. long. Remove valve spring and washer in the customary way, then raise valve as high as it can be lifted and insert the slotted pipe over the valve stem, resting lower end upon valve guide. Then bump the top of the valve carefully with a hammer and block of wood and the guide will come

#### Ignition Puzzle

CONTINUED FROM PAGE 31

ignition, replacing ignition units, starting engine was repeated. So was the starting and going dead.

• As a last resort the foreman installed a new coil, in spite of the fact that the coil in use passed all tests. The trouble was cured, the engine has not stopped on the road since.

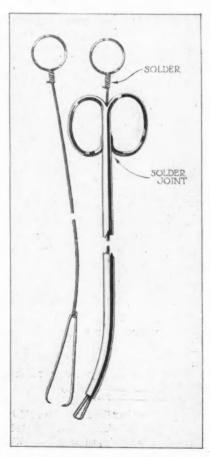

The foreman reasoned that heat developed by operation of the engine caused the coil to go dead. It passed tests while cold, but on the road some hidden flaw shorted it.

Is he wrong?

#### Fish Hook

TOOL which can easily be made in the shop and which saves much time and trouble in reaching into out-of-the-way places in engines and transmissions is used by H. M. Blair, Pittsburgh, Pa. It comprises a piece of copper tubing with a handle on either side of the top, like those in a pair of scissors, through which piano wire is passed to engage with a loop of piano wire at the end.

In use, the loop on the end of the long piano wire is pushed forward, releasing the two ends of the forked wire. When the wire touches the part to be removed, the piano wire is drawn up the tube, like a carburetor choke wire, until the forked piano wire grips the part tightly. The copper tube can be bent into any sort of curve required to reach the part.

The Commercial Car Journal and Operation & Maintenance

## MAINTENANCE CHATTER

For the Boys in the Back Room and the Men Who Work in Glass Cages

#### Chevrolet Parts

• Laminated shims for engine bearings and a one-piece valve cover gasket are now available as Chevrolet parts. Shims are supplied in sets for each bearing, including four and six-cylinder connecting rods and front, center and rear main bearings of both engines.

The one-piece valve cover gasket lists at 12 cents and may be ordered in any quantity from one up, there being no minimum package quantity.

#### I Dare You

• Traffic Cop-Who do you think you are, driving through town like that? Reckless driving, speeding, passing a red traffic light, almost hitting that kid. I'm telling you

that your driver's license will be revoked and that isn't all.

Driver-I am sorry about all that but you cannot revoke my

driver's license.
Traffic Cop—We can't revoke your license, can't we? You just wait and see what happens when we get to headquarters. What makes you think that we can't and won't revoke your license?

Driver-I haven't any driver's license.

#### Use No Tools

• Wire wheels now offered on Chevrolets embody drop center rims. There are no detachable rings or locking devices. The factory advises that tires be changed without using tools. In fact, the warning "Caution: Use No Tools" appears three times in a bulletin on the new wheels and the variation "No tool is necessary or advisable" is used once.

Those who drove automobiles before the days of demountable rims remember that fixing a puncture called for use of an armful of broken spring leaves, chisels and screwdrivers plus grim determination and a flow of cuss words

#### Diamond T Brake Drums

• Cast alloy iron brake drums are now furnished as standard equipment on rear wheels of all models of Diamond T trucks of two tons capacity or more, including Models 303, 551, 503, 506, 602, 606, 700, 801, 1000, 1200, 1600, 1601 and 2500.

#### The Foreman Hints

· Foreman-Mac, I see you have your golf overalls on today.

Helper—What do you mean,

golf overalls?

Foreman-The suit with eighteen holes in it.

#### Believe It or Go There

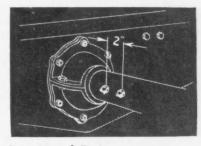

• Kerosene froze solid during cold spells at Little America, Antarctica, according to Commander Byrd, in charge of the expedition to the South Pole. Another effect of the cold was that sandwiches froze stiff and had to be thawed on exhaust manifolds before they could be eaten for lunch.

We wonder what the tappet clearance was at 75 below zero.

#### Ford Adds Lubricator

• Another lubricator has been added to the Ford AA truck torque tube. This fitting, which is installed just back of the universal joint ball cap, permits lubricant to flow directly to the universal joint without first passing through the bearing.

Torque tubes now carry an

Location of Fitting

extra boss for the fitting. Torque tubes now in use, or in stock, may be equipped with the additional fitting. Drill a 21/64 hole exactly 2 in. forward of the center of the hole for the present fitting and tap ½ in. taper pipe thread. This taper thread will make the lower end of the threaded hole just a little undersize and thus prevent the end of the lubricator from sticking down into the housing.

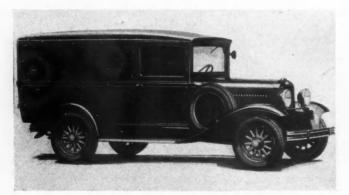

# DODGE DIVIDI

N recognition of the changes truck merchandising has been undergoing and which changes have practically resulted in the separation of most trucks into two groups, Dodge Brothers Corp. has announced a new line of trucks composed of two distinct groups of vehicles covering 11 chassis and 53 models when permissible tire variations are taken into account. The first of these, the Standard line, includes two 1/2-ton and two 11/2-ton models, a four-cylinder and a sixcylinder in both cases, is designed to compete with the so-called popular priced commercial vehicles. The second line, ranging from 11/2 to 3 tons nominal rating, inclusive, is designated as the heavy-duty group. Outstanding features of the Standard line are: new low prices, full floating axles and cast alloy iron brake drums, four-speed truck type transmissions on the 11/2ton, and new low-priced steel cabs, heavy frames and excellent performance. The 1/2-ton models have three transmissions and semi-floating rears. A full line of standard bodies is provided for the models in this group, with prices ranging from \$625 for the 1/2-ton four-cylinder canopy model to \$875 for the panel body 11/2-ton four-cylinder truck. The six-cylinder editions of the 1/2 and 11/2-ton Standard line are offered at \$100 additional cost for all models as compared with the four-cylinder line.

In connection with this new line of trucks, Dodge Brothers has developed a method for specifying maximum gross laden weight rating of all models. To this end a wide range of standard tire options covering both balloon and high pressure has been made available, and the maximum weights at both front and rear have been determined for the truck for each definite tire size. These weights are specified on a steel plate attached to the dash of the truck in the cab, with a statement that the warranty will be voided if the specified weights are exceeded for the various tire sizes.

For instance, on the 3-ton 170-in. wheelbase chassis, the maximum gross weight for which the truck has been designed is 4029 lb. on the front and 15,400 lb. on the rear. This corresponds with the figures given on the dash plate for 9.00/20 balloon tires, dual at the

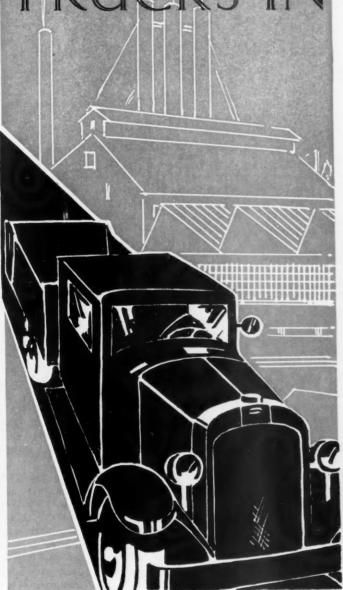

The 1/2-ton panel delivery with four-cylinder engine lists at \$645. Interior dimensions: length, 70 in.; width, 513/4 in., and height, 50 in.

# TRUCKS INTO 2 LINES

Standard Group Covers Popular-Priced Field and Second Group, Heavy Duty

rear. With a "normal" body and cab allowance of 1900 lb. and the chassis weight of 5729 lb., this would leave a maximum payload allowance of 11,800 lb. or almost six tons, giving an idea of the conservative tonnage classification of the new heavy-duty line.

Other features of the heavy duty line include highpower sixes; straight or double drop frames on the 2 and 3-ton models; large brakes equipped with BK boosters; five-stage rear springs; large 3-in. exhaust pipes; provision of cooling fins on the oil pans; 19-in. fan, twin-belt driven, and the adoption of an adjustable driver's seat-back in the cab.

In the establishment of the new gross rating method, Dodge Brothers states that it is receiving the cooperation of tire manufacturers. Five tire options are offered on each chassis model of the 2 and 3-ton trucks, with four tire options on the two 1½-ton chassis of the heavy-duty line. In the Standard line five options are again available on either of the 1½-ton chassis, while two tire options are offered on the ½-ton, four-cylinder series

The low prices on the Standard line have largely been made possible through the use of the Plymouth engine. In anticipation of this move, the Plymouth engine when recently changed was modified to adapt it to truck as well as passenger car use.

Double-reduction axles are standard on the Model F-60 3-ton, short-wheelbase truck. Note new radiator design and attractive cab

September, 1930

The engine has full pressure lubrication, a cooling capacity designed to comply with truck requirements, and develops 48 hp. at 2800 r.p.m.

The 1½-ton models carry a 10-in. single-plate clutch with ball bearing release. A standard SAE opening for the installation of a power take-off is provided on the four-speed transmission. Internal hydraulic brakes are standard on this, as well as all other Dodge Brothers truck models. A departure from conventional practice is the adoption of cast alloy iron drums.

Low prices for the six-cylinder models of the Standard line are similarly due partly to the use of the Dodge Six engine. The six develops a maximum of 61 hp. at 3400 r.p.m. A large factor in reducing vibration is in the use of aluminum alloy pistons throughout.

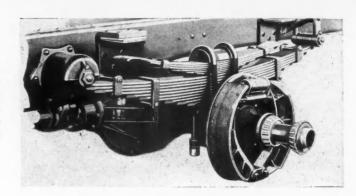

The Heavy Duty line covers three nominal ratings, 1½-ton, 2-ton and 3-ton. Actual pay loads, as already pointed out, may range as high as six tons, and still remain within the warranty rating of the truck. Two of the chassis which cover the heavy duty 1½ range, up to a possible maximum of nearly 2½ tons. Both have straight frames.

Both the 2 and 3-ton series models are powered with a six-cylinder, 310 cu. in. displacement engine. This engine, designed in its original form for the highest-priced passenger car produced by the Chrysler Corp., the Chrysler Imperial, has been widely redesigned for truck work, including larger exhaust pipes, cooling fins on the engine oil pan, and an improved cooling system generally, including a 19-in. fan driven by two belts. Governors are provided also for engine speed.

The engine is of L-head design and develops a maximum of 96 hp. at 3000 r.p.m., it is stated, with a compression ratio of 4.7 to 1. It is mounted at four points in the chassis, front supports being of the spring type, with rigid mountings at the rear.

Pistons are of the Invar strut Nelson type and carry five rings, the

View of the fullfloating rear axle and spring design on the 3-ton Model F-62 Dodge Brothers truck

lowest of which is of the oil-control type, with tongue and groove type compression rings for the upper four. The seven-bearing crankshafts have 97 sq. in. of bearing surface and weigh approximately 100 lb. Engine lubrication is by pressure to main, crankpin and camshaft bearings as well as to the front end chain drive. Oil passages are drilled in the block and upper crankcase. Such further features as crankcase ventilation, oil-wetted wire mesh air cleaner, and oil and gasoline filters are also provided. Fuel feed is by a variable stroke diaphragm type pump drive off the camshaft. An engine heat indicator is mounted on the dash.

Single-plate 13-in. clutches are provided on both the 2 and 3-ton series.

The four-speed transmissions are mounted in unit with the engine. With a 6.375 to 1 reduction in the 2-ton and an 8.436 to 1 ratio on the double reduction 3-ton axle, this transmission provides for an overall reduction in low of approximately 44 to 1 and 58 to 1, respectively.

The double-reduction axle mentioned is standard equipment on the 146-in. short wheelbase 3-ton range and is available at slightly extra cost on all other 3-ton models, as well as on the 2-ton.

On the 2 and 3-ton models there is also an unusual spring design to provide increasing spring re-

sistance or stiffness with increasing load. During a spring deflection, the first stage is taken care of entirely by the main spring, which is 3½ in. wide. Next one end of the helper spring contacts against a frame bracket, and when the other end of the helper spring contacts its bracket, the third stage is entered. If deflection continues, the top leaf of the main spring will contact one end of the helper spring bottom leaf, and build up further resistance to deflection as a fourth stage. The fifth stage is reached when the main spring top leaf contacts the other end of the helper.

Frames on the models are provided with an exceptionally heavy box-type cross-member located at the front shackle of the rear spring, and gusseted to both upper and lower frame flanges. A cross-member is also located at the rear shackle, so that frame deflection under spring loads should be greatly minimized. Incidentally, the frames on the 2 and 3-ton models have 10-in. deep side channels.

Malleable iron spoke wheels are standard on the 2 and 3-ton series. Spare tires are carried on straight frame models under the frame at the rear. On trucks with double drop frames a compartment for carrying tires is provided at one side of the frame just back of the cab, balanced at the opposite side by a large tool box.

In connection with the announcement of the new Dodge truck line, some important distribution and merchandising changes have been put into effect. Of primary interest is the establishing of 85 depots or warehouses, each under the control of the dealers in the particular territory, with the cooperation of the factory. Each depot will keep available a full line of heavy-duty trucks for delivery and display, thereby relieving the dealer of the necessity of carrying an extensive floor display of Dodge trucks. In addition, the depots will carry complete stocks of replacement parts, accessories and a line of representative bodies.

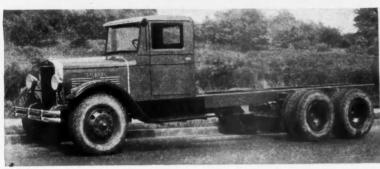

Dodge Brothers Corp. is also building up its special equipment division to a point where it will be able to supply for any model of both lines any type of body or equipment which may be desired. In this project Dodge is working cooperatively with prominent body and equipment manufacturers to insure a complete coverage of the field.

# DODGE DIVIDES NEW TRUCKS INTO 2 LINES

### NEW DAY-ELDER LINE HAS ELEVEN MODELS

Four-Wheelers Offered in 1 to 5-Ton Range and Six-Wheelers from 8 to 12

The new Day-Elder line is at once graceful in lines and sturdy of construction. The top view is that of the 3-ton Model 160 and the lower, of the 8-ton Model 285 six-wheel chassis

COMPLETE line of fourand six-wheel Day-Elder trucks is announced by the National Motors Mfg. Co., Irvington, N. J. Designated as Super Service Sixes, the line comprises 11 models: seven four - wheelers ranging from 1 to 5 tons capacity inclusive, three six-wheelers rated at 8, 10 and 12 tons, and one 20-passenger bus.

Standardization of assembly characterizes the entire line. Make of units, which are well known and of the latest design, are largely the same throughout

the range, varying only in capacity. Every model is equipped with a Continental six-cylinder engine, Delco-Remy starting and lighting, Zenith carburetor, Ross steering, four-wheel brakes, Timken rear axle, balloon tires, air cleaner, fuel pump and stop light.

In designing the new line, particular attention was given to external effects, with a view of combining the attributes of attractive appearance, driver comfort and performance. From bumper to stop light, each model

presents attractive streamline effect much along the lines of present-day passenger car design. Fixtures are chromium-plated throughout, including radiators, head lamps, bumpers, door handles, hub caps, etc. Cabs are of the inclosed all-weather de luxe type with seats upholstered in genuine leather and appointed with such items as cigar lighter, automatic windshield wiper and speedometer in modernistic design.

While powered entirely by Continentals, all but the 1, 1½, 2 and 12-tonners are furnished with R type engines. Unit powerplants are employed on all the four-wheelers except the 5-ton model, which together with the six-wheelers have amidships mounted transmissions. Brown-Lipe disk-type clutches are used throughout except in the two lighter models where plate type Borg & Beck are employed. The two light models again depart from the regular line-up in the use of Warner Gear transmissions, while Brown-Lipe characterize the rest of the line. All provide four speeds in the four-wheelers and seven in the six-wheelers.

Final drive is through Timken bevel and worm drive axles, bevels being employed in the first four models and worms in the remainder with SW tandems in the six-wheelers. While four-wheel internal brakes feature the entire line, mechanically operated Bendix are furnished in the two light models, Lockheed hydraulic in the next six and air in the last two.

Hand brakes operate on the propeller shafts, through shoes contracting on drums in the first four models and disks in the remaining models. Springs are silico-manganese semi-elliptic with helper springs mounted over the rears, and frames are of semi-flexible pressed steel.

### Specifications of New Day-Elder Line

# NDER PACKS SPEED

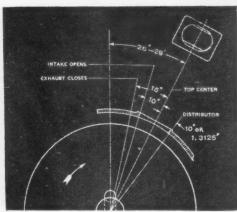

# ENGINE REPAIR STANDARDS

Packs for A-4 and A-5 Sixes Comprise Sleeve Fitted With Piston, Rings, Pin and Lower Packing

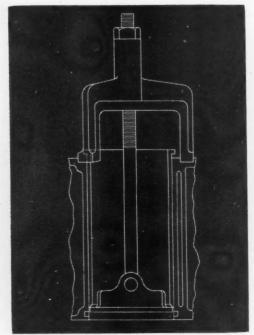

HE six-cylinder engine used in International Harvester Models A-4 and A-5 embodies many features of special interest to maintenance men. Cylinder sleeves are removable, three types of pistons provide standard and two higher compression ratios for high altitudes, two types of high tension magneto are supplied at extra cost in place of standard battery distributor, main bearings are lubricated by passages leading from camshaft bearings and intake and exhaust valves are not the same size.

Repairing a worn or scored cylinder, or set of cylinders, requires neither honing nor fitting of pistons to cylinder bores. The cylinder sleeve is withdrawn by a puller, which fits cylinders of four-cylinder engines. A cylinder pack, comprising sleeve with fitted piston, rings and pin and lower packing is then installed in place of the old sleeve. These packs may be obtained from IHC dealers and

Standard pistons are installed in engines for regular production but two other types are available for trucks operating in high altitudes. One special type is designed for 5000 ft. altitude, the other for 10,000 ft. levels.

IL PRESSURE

At right - Pistons and connecting rod assemblies are withdrawn from below in the International Harvester sixcylinder A engine. The overhead valves which are carried in a removable cylinder head are fully inclosed

At left — Cylinder sleeves may be removed without trouble by making use of special puller which fits all IHC engines of this type

At far left-Valve and ignition timing looking from the crank end of the engine

# IHC ENGINE

Standard ignition equipment is a Delco-Remy battery distributor, of semi-automatic advance type. Either American Bosch or Robert Bosch high tension magnetos are supplied on order, at extra cost. Both magnetos are equipped with impulse starters. Difference in setting of breaker points and in timing ignition between distributor and magnetos is shown in the accompanying table.

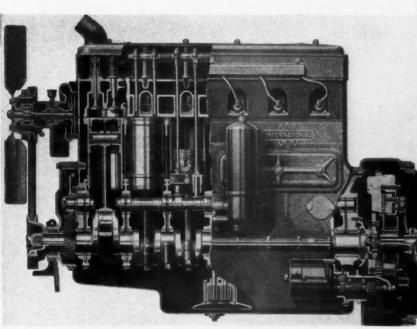

Main and connecting rod bearings and camshaft bushings are furnished in undersizes for reground shafts, in addition to standard sizes. Main bearings, which are interchangeable, non-adjustable type and connecting rod bearings, which are integral with rods, are supplied in .020 undersize and in standard size. Camshaft bushings are listed standard and .010 undersize.

Valve and ignition timing are set by reference to flywheel marking. Inspection hole is on side of flywheel housing and mark of U.D.C. applies to cylinder No. 1. Intake opens 10 deg. after upper dead center, which equals 1.3125 in. measured on flywheel rim. Exhaust closes 15 deg. after top dead center. Valve timing is checked with tappet clearance of .016 in. which is not the correct operating clearance. Ignition timing point is 10 deg. before top dead center. Timing positions are shown in the diagrammatic illustration on the preceding page.

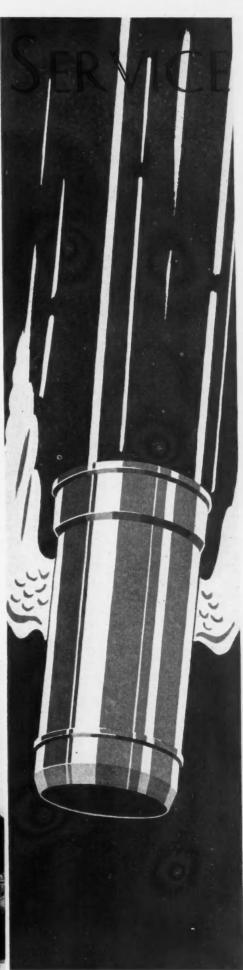

Piston pins float in rods and in pistons. For service work .005 and .008 in. oversize pins are listed. Connecting rod and piston assemblies are removed from below.

Camshaft is carried in seven bearings and the shaft itself serves as main oil header for the pressure lubrication system. A groove in each camshaft journal carries oil to a lead for the corresponding crankshaft journal.

The factory recommends extra heavy oil, S.A.E. viscosity No. 50, for summer, and a medium oil, S.A.E. viscosity No. 20, for winter operation.

The Commercial Car Journal and Operation & Maintenance

September, 1930

# WHAT HOLDS THE REAR AXLE ON?

CONTINUED FROM PAGE 23

mit the power. It also applies to many of the trucks.

"How about all this semi, threequarter and full business?" Mac interrupts.

"I'm just getting to that," we answer. "As I so clearly explained to you before, a live axle differs chiefly from a dead one in that the axle housing takes over some of the work of carrying the load. The extent to which it absorbs the various stresses determines the amount of float of the axle shafts. If these shafts do nothing but transmit the driving power the axle is full-floating. If, as in the old Model T. the axle shafts also carry all the load in addition to the power stresses, the axle would be called nonfloating. In between are other axles carrying varying proportions of nondriving loads."

We Shafts Need Help •
HY have an axle housing at all,

if the shafts can be made to do all the work?" asks Mac.

"Why put a brick facing on a frame house?" we counter.

"It keeps the hot air in in the summer and the cold air in during the winter," Mac says. "And also it looks better, and it does help to stiffen the whole thing up some."

"99 44/100 per cent correct for axle too, Mac," we state. "But in some houses the bricks really have a load-carrying job to do, just as in axles. And if it's a good size building there also is a steel framework. The bigger the house or the axle, the greater the danger of over-stressing any one part. In an axle for a real big truck, the shaft has plenty to do just transmitting the power. It's a case of letting George do some of the chores."

"Well," says Mac, "all the half, three-quarter, fifteen-sixteenth and one-half of one per cent axles look alike to me. I suppose they've all got shafts inside the housings."

"You've figured that one out right, Mac," we try to cheer him up. "It isn't easy to see the difference unless you take them apart and differences between the types really depend on pretty small things, such as where you put the bearings, and how the wheels are mounted.

"Here (Fig. 1) is a sketch of a semi-floating axle. The wheels are rigidly attached to the axle shafts. Both the weight of the car and the twisting on the axle due to the wheels trying to fold up when going around corners have to be taken by the shaft. Those shafts have as many things to worry about as you do on the first of the month. In this axle, as in the non-floating type, if the shaft breaks, you may have to go back down the road to pick up the wheel too. And the side stresses on the wheels are still carried by the axle shaft.

"If there is more load than you would like to have the shafts carry, and you don't want to make the shafts a lot bigger to take care of it, the next step is to take the wheel end bearing off the axle shaft and place it outside the housing, generally directly under the center of the wheel. This set-up we then call three-quarter floating. The direct weight load is now all removed from the shaft and is carried by the housing. But the wheel is still keyed to the shaft, and if it tried to fold up under the truck when going around a corner, as if it has just come out of a speakeasy, or if the axle housing is bent, the stresses to these conditions are still carried by the axle shafts. And if the shaft breaks, the broken end, wheel and all, is still likely to kiss the truck goodby.

In the relay drive shown in Fig. 5, the wheels are carried on a dead axle but the weight is not carried directly on the axle, as in ordinary construction, but is carried down to a separate housing surrounding the axle drive shafts. So far as the drive at the wheels is concerned, there is a pinion and ring gear as in the interior gear drive but the Relay axle makes use of a pendulum principle for driving. But that is another story.

The way in which all loads are taken off the axle shaft without using a dead axle is to use the full-floating type of construction. In this design each rear wheel is mounted on two ball or roller bearings on the outside of the axle housing. These bearings are arranged to take thrust in both Turn to page 52, please

### Tearing the Mask From Oil Thieves

CONTINUED FROM PAGE 28

grooves. Drain holes are shown in Fig. 3 and Fig. 4.

Too much clearance between piston and cylinder wall causes a lot of oil pumping for which other parts are unjustly blamed. Of course, it is possible for a ring to do more than its share of the work, but that does not release pistons from their responsibilities.

The first effect of too much clearance is that the film of oil on the cylinder wall is too thick. The lower edge of the piston scrapes excess oil off, leaving a film as thick as the space between piston skirt and cylinder wall. Oil control rings reduce this film to the desired depth. Obviously, if piston clearance permits this film to be twice as thick as normal the oil control ring has just that much more scraping and controlling to do.

Bent connecting rods cause an artificial condition of varying clearance, too much on one side and too little on the other, or too much at the top and not enough at the bottom. Plain evidence of this condition is given by wearing surfaces of the piston, bright in one place and black with carbon in others. Out-of-round and scored pistons also advertise their shortcomings by dark and light areas on pistons.

### T● Give the Ring a Break ●

APERED and out-of-round cylinders bring about oil pumping because they increase clearance between piston and cylinder wall and they make it difficult or impossible for a ring to conform to their varying surfaces. It is asking too much of a ring to expect it to change its shape and size four or five thousand times a minute. Many of them make excellent showit was when the trip started. Engine over bumps at an average speed of 30 m.p.h. coming to a complete stop every 6 inches. That is what a ring does in a worn cylinder.

Distortion of cylinder bores under heat of operation of an engine is a cause of oil pumping in some engines which almost defies detection. When measurements are made with the engine cold everything is okay. But when the engine is hot, not warm but hot after miles and miles of travel at high speed, the cylinder is not the same shape and size throughout that it was when the trip started. Engine designers have practically licked this trouble in modern powerplants.

Poor oil or oil not adapted to the conditions under which it is used naturally causes loss. An oil which is quite satisfactory for 10 below zero might not do at all for wide-open operation at 100 in the shade. In detecting this particular culprit shopmen have able assistance from two sources, engine makers and oil refiners. Both groups maintain costly research to determine the sort of oil best adapted to any condition.

# EQUIPMENT FOR THE SHOP

### Kingpin Reamer

Alvord-Polk Tool Co., Millersburg, Pa., is making a reamer with an inserted pilot adapted for reaming kingpin holes on all trucks whose frontwheel brake construction makes it impossible to pass the reamer through

two aligned bushings. While the near bushing is being reamed the pilot, inserted in the second bushing, guides the cutting edges. When reaming the second bushing the pilot is removed and the reamer shank serves as the guide.

### Transmission Hoist

Adjustable to all makes of trucks, the new transmission hoist brought out by Shepard & Moore, Inc., 1514 Prospect Ave., Cleveland, eases trans-

mission removals. Operable by one man it consists of a tubular arc mounted on roller feet, a ratchet wheel and lifting chain. It straddles the gap between body sills upon which it also may be rolled into position. The weight is 20 lb. and the price, \$13.80.

### Bendix Wrench

This is a new special 16-in., 12-point double-end box wrench supplied by the Bendix Service Corp. to fit anchor pin nuts of all Bendix duo-servo brakes between the sizes of 11 and 16 in. It is known as No. 2.

### Piston Ring Compressor

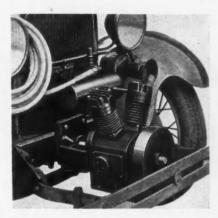

Allen Electric & Equipment Co., Kalamazoo, Mich., is offering a handy shop device for holding rings in position in piston, permitting easy installation of pistons from top or through bottom of cylinders. Set No. 21 consists of a pair of tongs and four bands to accom modate rings ranging

from 2% in. to 4½ in. and lists at \$2. The tongs are long for leverage and possess a swivel action to permit easy manipulation at any angle.

### Portable Compressor

An air supply ready for instant use wherever and whenever needed is available when a service truck is equipped with the new portable air drum. It is designed for the use of compressor announced by the Globe Manufacturing Co., Battle Creek, Mich. The unit mounts on the front of the service car and is driven from

the engine crankshaft by a patented power take-off. When air is required it is only necessary to throw in a lever, which engages the compressor and starts the engine. The compressor is of the V twin-cylinder type of 2 in. bore and 2½ in. stroke and capable of developing 200 lb. pressure.

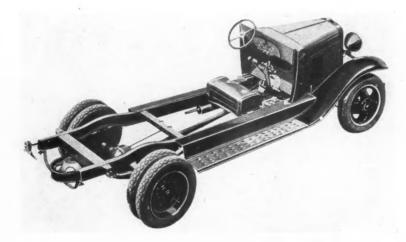

### Piston Pin Tool

)-'0

y il This tool, made by Stevens Walden, Inc., Worcester, Mass., is designed for quickly inserting and removing piston pins in Ford Model A. The tapered nose of the tool guides the pin past lock-ring in connecting rod. There are parallel flat surfaces on the tip so that it can be removed by a wrench. Price, \$1.50.

The Commercial Car Journal and Operation & Maintenance

### CHEVROLET OFFERS DUALS ON 1½-TON AT \$25 EXTRA

Communication of the Control of the

Top—This view of the Chevrolet 11/2-ton truck shows the dual wheels which are supplied at \$25 extra. The webbed type pressed steel spoked wheels are the standard types now

Bottom—Rear brakes on the new Chevrolet are now of the internal articulated shoe type. The two larger shoes are for service, and the two smaller for emergency braking

Changes Include Heavier Axle, Steel Wheels and Larger Brakes

HANGES characterized as sufficiently important to call the 1½-ton Chevrolet truck a new model, have been announced by the Chevrolet Motor Co. Included in the changes are a heavier rear axle, new pressed steel wheels, internal expanding 4-wheel brakes of the articulated shoe type, and the optional provision of dual wheels.

Base price of the 1½-ton chassis remains unchanged at \$520, with an extra charge of \$25 for the dual wheels including six heavy-duty high-pressure tires. The new standard wheels are of webbed pressed steel, interchangeable front or rear and carry 30 x 5-in. six-ply tires. The axle is quite similar to the previous design, of semi-floating type with spiral bevel gears, but is specifically designed to withstand the additional loads imposed by increased carrying capacity with dual rear wheels. Axle shafts have been increased to 25/32 in. in diameter at the wheel bearings, and gears are heavier than formerly.

The brakes adopted for the Chevrolet 1½-ton truck are of the same type of design as those used on other Chevrolet models, except that they are of course larger, with 16-in. drums at the rear. Changes have also been made in the frame for increased strength. A new type crossmember has been added at the rear support of the gas tank, for instance, this member being of the U-type, with additional flanges at the bottom for rigidity.

According to H. J. Klingler, vice-president and general sales manager, the chassis is built complete with cab, while affiliations of Chevrolet with body manufacturers enable the purchaser to choose the exact type of body for the work to be done from a selection of 36 body types, the information being supplied by Chevrolet while bodies are to be supplied by the body manufacturers direct.

# FEDERAL PUTS TANDEM AXLES ON THREE UNITS

Parts Interchange is Feature of New 6 and 8-Ton Six-Wheelers

LTHOUGH a number of six-wheel trucks have been produced by the Federal Motor Truck Co. during the past few months, no official announcement of this fact has been made. The increasing demand for this type of truck, however, has led Federal to officially add a line of tandem-axle trucks to its regular products and offer them for general distribution.

The line consists of three models, the U6SW, rated at 6 tons and equipped with hydraulic brakes; the U6SWAB, with the same rating, but equipped with air brakes, and the 4C6SW, rated at 8 tons capacity. The tandem rear axle construction is of Timken manufacture, SW200 units being used on the U6 series and SW300W on the heavier model.

In introducing these trucks as few changes as possible have been made in the basic truck design in order to maintain maximum interchangeability of parts wherever possible. Thus the 4C6SW is virtually the 4C6AB truck with the tandem rear axle unit in place of the regular single axle. With the dual rear axles, however, capacity has been increased to a gross allowable weight of 34,000 lb.

The two U6 six-wheel models, however, have undergone some additional changes. Outstanding of these is the use of a larger Continental 20-R engine, rated at 90 hp. at 2200 r.p.m. It is of the six-cylinder valve-in-head type, with a bore and stroke of 4½ x 4¾ in. Crankshafts are of the seven-bearing type and 2¾ in. diameter. Ignition is of the dual type.

Frames on these models have been materially strengthened with the provision of additional inside brackets and reinforcements and the addition of outside fishplates. Dual wheels are used on both rear axles, and six-wheel hydraulic brakes are standard equipment on the U6SW. The U6SWAB, as has been mentioned, is equipped with six-wheel Westinghouse air brakes.

The Timken SW axles, it will be remembered, are of the full-floating, worm-drive type.

Included in the announcement of these trucks is a statement that a full line of Federal-built cabs and bodies are available to fit all chassis. To this end an addition was made to the Federal plant to permit building of any type of body for all Federal trucks.

Timken SW tandem units are employed in all three of Federal's new six-wheelers

# Special Bodies Make

### Municipal

Because of equipment such as this there is no excuse for a reluctant light in the City of Detroit (Fig. 1). The truck is a 2½-ton Model K Standard owned by the City of Detroit and equipped to take care of any lighting emergency as well as regular maintenance. The tower, made by the Wood Hydraulic Hoist & Body Co., is located between cab and body. The small box-like body serves as a storeroom for supplies. On each side are tool boxes and hooks supporting ladders and large implements. The rear end is virtually a work bench equipped with vise, lead heating pot, tools, etc.

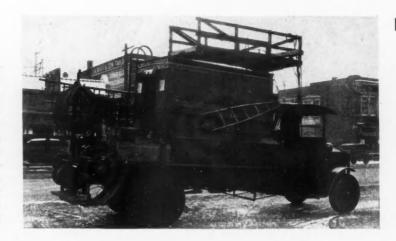

Gone are the days of the clumsy and unsightly ice cream delivery truck with its monstrous double type body spilling ice and brine as it shakes its way ponderously over pavement on solid tires. The ice cream delivery truck of today in contrast is clean and attractive (Fig. 2). The accompanying illustration is an example of a modern ice cream truck which covers a much larger territory at a lower cost than the older type and at the same time is effective as an advertising medium. The body is refrigerated by dry ice and is mounted on a Diamond T.

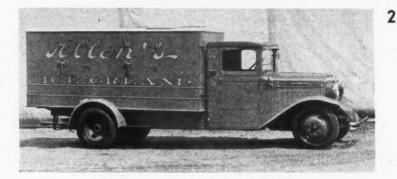

### Van-Bus

Van men take notice! This Dr. Jekyll and Mr. Hyde van-bus idea as worked up by F. T. Shirlock, furniture mover of Torrington, Conn., makes possible a very economical service for suburban schools without the need of owning buses for four-hour-a-day use (Fig. 3). Mr. Shirlock, whose business requires eight trucks, has a contract with the Torrington High School for the daily transportation of its pupils. Operating as a school bus two hours in the morning and two in the afternoon, the Shirlock van-bus converts into a spacious van for six hours work each day. The body is mounted on an Autocar 2-ton chassis.

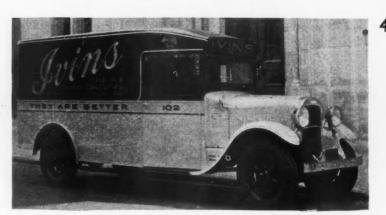

### Baker

J. S. Ivins Sons, Inc., Philadelphia, believe in sending forth its famous line of crackers and cakes in limousine style and comfort, recognizing that quality of product is reflected by association (Fig. 4). The body is designed to attract attention by its spick-span appearance. Ivins' bodies are finished in rich cream, bright red and gold lettering. The body space was carefully calculated to accommodate certain size tubs in the most convenient way. The interior is fitted with folding racks and tie ropes to hold the merchandise in place. The chassis is a Federal.

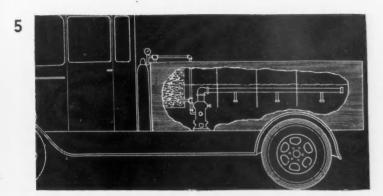

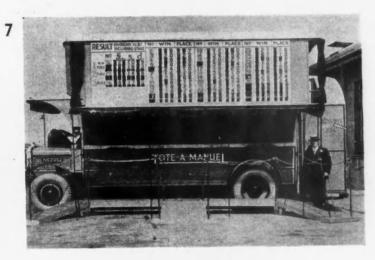

The Commercial Car Journal and Operation & Maintenance

# TRUCK SCOPE BROADER

The Commercial Car Journal and Operation & Maintenance

### Live Fish

In the future live trout taken from Oregon hatcheries and destined to live in various state streams will ride to their new locations in a truck which has all the latest fixtures of piscatorial elegance (Fig. 5). This new "fish pullman," which saves the Oregon Game Commission about \$50 a day, is equipped with a 220-cu. ft. tank and a special oxygen aerator. The treated water permits the accommodation of twice the number of fish generally carried.

The aerator, designed by Ansel R. Clark, of Portland, Ore., is built into the tank and is operated entirely by oxygen pressure. Water is admitted to the device through a series of chambers and channels where it is subjected to a tornado of pure oxygen under pressure. The oxygen-impregnated water then moves through a horizontal pipe to the opposite end of the tank where it is discharged under the surface of the water.

### **Furniture**

When customers of the Lakewood Storage Company of Cleveland decide to move their worldly possessions, they do so in regal style (Fig. 6). A furniture van, gigantic and attractive, rolls quietly up to the vacating customer's door and the removal is performed quickly and efficiently. The unit consists of a White 51 tractor, a Highway trailer and Hoffman body. The body is 30 ft. long and 8 ft. wide, and contains 1600 cu. ft. of space, which is ample for carrying the entire furnishings of two six-room apartments, including pianos. Unlike the usual tractor-trailer truck, there is no gap between the cab and trailer but is close-fitting with a streamline effect from bumper to tail light because of the concave and convex construction of the cab and front end of the body.

### Bookie

Excited English race-track habitues placing bets with the operators of this new portable betting office, known as the Totalisator, are not kept in the dark as to the odds their favorites are paying as in the days of the busy bookie or at tracks not equipped with a mechanical calculator (Fig. 7). A glance at the board keeps them constantly informed of the ever-changing odds as long as betting continues. Tickets are issued and totals can be seen from each side of the vehicle. The inventor, Fred Howard, is standing at the entrance of the gangway.

### Dry Ice

Meat consumers of Detroit were impressed recently by new dry refrigeration motor equipment placed in operation by the Great Atlantic & Pacific Tea Co. (Fig. 8). This equipment, used in daily meat delivery, assures distribution of meat in good condition. The body, insulated with special Balsa panel and Kapoc, is 15 ft. long, 6 ft. high and 6 ft. wide, inside dimensions. The interior is equipped with removable shelving, and hooks for hanging beef. Dry ice reservoirs are also furnished. The body is made by Fitz-Gibbon & Crisp, and is mounted on an Autocar chassis.

### TRUCK INDUSTRY NEWS

GENERAL

The White Co. has announced the new Model 613 six-cylinder school bus chassis incorporating several safety features. A double drop frame provides an extremely low center of gravity, and the braking system is composed of four-wheel hydraulic brakes, equipped with a vacuum booster. The wheelbase is 180 in. and the chassis is designed for 16 to 21-passenger body.

The Bureau of Agricultural Economics, Department of Agriculture, is working on a survey to determine the importance of motor truck receipts of fruit and vegetable supply in some of the country's leading market centers and to ascertain the volume of truck movement as compared with movement by rail and water from representative producing areas.

The price of Stewart's new 1½-ton Model 40 chassis is \$895 and not \$850 as published in error in the description appearing in the August isue.

ERNEST W. STEPHAN, THE NEWLY APPOINT-ED MANAGER OF BRANCHES FOR REO Aluminum alloy tanks for transportation of inflammable liquids by motor trucks are being tested by the National Fire Protection Committee on Flammable Liquids, the Aluminum Co. of America and the American Petroleum Institute Committee.

Opening of a tire repair school offering four weeks of free instruction to all repair men in its dealer organization is announced by the United States Rubber Co. The school, located in Detroit, is under the supervision of Charles Samson.

The Maryland Automobile Trade Assn., located in Baltimore, has organized a Truck Operators' Bureau composed of operators of large fleets of trucks to consider tax legislation, reciprocal relations and other subjects affecting the industry.

Included in the exhibit of the American Bottlers of Carbonated Beverages to be held Nov. 10 to 14 in Milwaukee in conjunction with that body's annual convention will be a display of truck equipment used by bottlers.

### **FACTORY**

Brockway Motor Truck Corp. net earnings for the six months ended June 30 were \$212,335 after all charges.

A gain of 26.2 in truck sales for the first half of 1930 over the same period of 1929 is reported by the Four Wheel Drive Co. The company also reports that July and August bookings instead of being seasonally down are over those of last year.

Manufacturing rights of the Weber Trailer Coupling Hook have been obtained from the Weber Trailer & Mfg. Co., Los Angeles, by the Sterling Motor Truck Co., which company will distribute it east of the Rocky Mountain region.

The Budd Wheel Co. has produced 4,107,630 wheel units during the first six months of 1930, which compares with 4,515,705 units produced during the same period of 1929, according to H. A. Coward, secretary of the company.

Thermoid Rubber Co. reports net profit for six months ended June 30 of \$283,294. This compares with \$464,850 for the same period last year.

OSCAR C. KREIS, WHO

ENGINEER FOR
STUDEBAKER CORP.

Stockholders of the Federal-Mogul Corp. have voted to increase the capitalization of the corporation to provide for expansion through acquisition of the Watkins Mfg. Co. and similar units.

McQuay-Norris Mfg. Co. for six months ended June 30 report net income of \$300,040 after all charges, which compares with \$456,000 in the corresponding 1929 period.

Mack Trucks, Inc., reports net profit for quarter ended June 30 of \$1,409,924, which compares with \$490,709 in the first quarter and \$2,481,541 in the June quarter of 1929.

Goodyear Tire & Rubber Co. reports net profit for the six months ended June 30 of \$5,592,309 after all charges. This compares with \$12,633,865 for the first half of 1929.

Federal Motor Truck Co. has reported for six months ended June 30 net profit of \$191,458, which compares with profit of \$315,771 for the same period last year.

The White Motor Co. reports net earnings for six months ended June 30 of \$1,048,000, which compares with \$1,404,000 for the same period last year.

Bendix Aviation Corp. reports earnings for quarter ended June 30 of \$779,255 after all charges.

### PERSONAL

A. C. Pearson, chairman of the board of the United Business Publishers, Inc., owner of Commercial Car Journal & Operation and Maintenance, has been decorated with the Legion of Honor by the French Government. Mr. Pearson was one of the few civilians to receive the certificate of service of the Council of National Defense without being in the service of the United States during the war.

R. P. Page, Jr., president of the Autocar Co., and Walter S. Graves, sales director of the Dodge Bros. truck division, have been appointed to the Motor Truck Committee of the National Automobile Chamber of Commerce.

Edw. S. Otton resigned as head of the Trade Sales Division of the Moto-Meter Gauge & Equipment Corp. to join Hurley-Townsend Corp. of New York as sales and advertising manager.

Henry Kennedy has been appointed regional manager for the Reo Motor Car Co. in the midwestern region.

A. C. PEARSON IS HONORED AND DEC-ORATED BY FRANCE

Walter Emerson Frank Radtke has been appointed Pacific Coast sales representative of the Hercules Motor Corp. of Canton, Ohio, with headquarters in the Russ Building, San Francisco.

At the recent meeting of the board of directors of the Ohmer Fare Register Co., Robert C. Lee of Cleveland was elected a director to fill a vacancy on the board.

Arthur G. Underwood has been advanced from the position of manager of accessory sales to that of assistant sales manager of A. Schrader's Sons, Inc.

H. H. Hageman has been appointed manager of the northwestern branch of the Firestone Tire & Rubber Co. with headquarters in Minneapolis, Minn.

L. DeLigouri has been appointed regional manager for the northwest region of the Reo Motor Car Co.

Jere E. Dodge, formerly branch branch manager of Reo at Atlanta, has been advanced to the office of regional manager for the South Atlantic region.

Carl G. Anderson has joined the Sterling Motor Truck Co., Milwaukee, in the capacity of regional sales director.

D. P. Brother has been advanced to the office of director of advertising of General Motors Corp.

"Herb" Shaughnessy has been appointed to the office of sales manager for the Trainor National Spring Co.

### TIRES NEED NURSING FOR MILEAGE HEALTH

CONTINUED FROM PAGE 20

split rims should line up and close within certain definite limits. The standard established by the National Rim and Wheel Association is alignment within 1/64 in. and close within 1/16 in.

Of the penalties of under-inflation the rim bruise is probably the most insidious. It is caused by the tire hitting an obstacle in the roadway with sufficient force to drive the tire up against the rim. The tread and sidewall rubber being very tough seldom show where the tire came in contact with the object. A tire injured in this way rarely fails at once. It may run for many miles and then go suddenly flat on a smooth roadway or while the truck is standing still. The reason is that the break is generally small at first but the flexing of the tire enlarges it until the tube works into the break and is pinched. If the tire strikes an object at an angle the result may be an outside break, appearing just above the rim flange. In such cases the break can be spot repaired and the danger avoided. The best way to avoid rim bruises, however, is to keep the tire properly inflated.

### • Tread Wounds •

ASINGS should always be examined for tread cuts and when discovered repaired immediately. Such cuts while not causing a flat, allow moisture and dirt to get to the breaker strip. The flexing action of the tire enlarges the cut and the foreign matter tends to loosen the fabric from the tread, weakening and rotting the carcass and eventually causing blowouts. The remedy is an inexpensive spot repair, which is simply a sealing of the incision with rubber. Neglected tread cuts frequently reveal themselves in the form of the wellknown "sand blister."

Blow-patches or removable boots should only be used for an emergency until such time as a permanent repair can be made. Failure to replace a boot with a repair is a wanton waste of money because the patches quickly chafe the inside of a tire beyond repair. The remedy is a first-class sectional vulcanizing job as soon as possible.

Daily inspections should also include a careful search for small objects such as pins, tacks, glass, small stones and pieces of steel, etc., that imbed themselves in the tread and work themselves to the carcass until removed. They may eventually puncture or cause slow leaks.

### Wheel Infirmities

WHEEL out of line exacts a heavy toll from the tire. Wear is rapid, sometimes ruining a tire in a few hundred miles. Such a wheel does not run true and drags and side slips a tire over the road, scuffing away the tread. The effect is the same as rubbing the tread with a file. Misalignment may be due to improper toe-in, toe-out, or camber, a bent axle or steering knuckle, or a loose bearing. Too much camber is quickly detected by excessive wear on one side of the tire. Whatever the defect of misalignment, it should be promptly determined and corrected. Wobbly wheels are just as injurious to the tire, causing it to wear flat in spots. Wobble may be caused by uneven application of the rim to the wheel or to the wheel itself not being true.

A dragging brake, in addition to increasing brake expense, which in itself is an item of sufficient importance from the standpoint of safety and expense to demand attention, causes one tire to work more and wear faster than the other. Besides causing the tire to wear away in spots both bead and carcass are caused to deteriorate because of the heat generated in the brake and passed on to the tires through wheels and rim. Brakes should be equalized by specialists in that work.

In addition to the aforementioned there are other factors that contribute to long tire life. Clean garage floors keep the tires healthy. Floors covered with oil and grease attack the rubber, deteriorating it. It is also generally recommended that tires only worn to the cords and showing no serious defects of abuse can be economically reconditioned by applying new tread rubber.

### Professional Clinics

EXPERIENCE has shown that unless an operator is large and can keep personnel and equipment busy, service can be obtained more economically and efficiently from a tire service station (or truck dealers set up to furnish such service). This is particularly true of operators of 10 units and under. To service his own

equipment would entail the investment in inflation equipment, although this particular item is always desirable no matter how small the fleet, tire changing apparatus, tools, repair equipment, etc., with attendant interest, depreciation, maintenance and operating charges, plus the expense of trained service men.

Tire service stations are set up to provide this service—they have the equipment, expert personnel and are able to distribute operating charges over a larger area. These advantages can be taken over with profit by the operator. As a matter of fact tire service stations are anxious to perform this service because it means a satisfied customer with good prospects of repeat business, upholding of good name of product and service sales. The latter reason, however, is not true in all cases, because some dealers provide for servicing cost in the initial tire charge.

Companies providing service of this character generally operate along similar lines, varying mostly in frequency of inspections, method of contacting customer, following up, etc., and time of inspections.

The following plan of a tire dealer, located in a large Eastern city, and who has met with commendable success, is particularly interesting.

### Night Nursing

HIS dealer has equipped two trucks with complete tire servicing equipment, virtually service stations on wheels. Operating on a strict itinerary these trucks contact every customer on the list once a week. Furnished with garage keys by customers, an expert tire man and helper work through the night checking pressures and examining and correcting tires. A Weekly Inspection and Service Report is made out in duplicate at each stop, which provides tire information on each truck examined. It shows what the inflation pressure of each tire was and what was put in, what valve replacements were made (caps, insides and nuts), condition of alignment and a place for remarks covering tires needing repairs, recaps, rim inspection and other unusual conditions.

These reports are filed for reference and are used to show the owner what repairs are needed, how his tires are used by his drivers and how his tires are performing generally.

Examples of what regular tire service accomplishes are many, of which the following are a few:

The Washington Railway & Electric Co. in 1926 was operating 55 buses. Today this company operates 115. In May, 1926, the company com-

# how would you like to silence them?

Do you have complaints from your drivers about brake linings? Most fleet operators do. That is why so many of the biggest companies have turned to Ferodo Linings. Drivers find that the brakes need less attention, require fewer adjustments, and are less subject to variation because of moisture, oil or heat—in short that brakes are more dependable when Ferodo Linings are used.

This is not just an empty claim. It is a fact. The big fleet operating companies will confirm it, for they are users of Ferodo Linings and know Ferodo's advantages from actual experience.

Ferodo Linings cost a little more per foot, but their superior service is worth a much bigger premium. That many people share this view is proved by the fact that Ferodo's is the fastest growing brake lining business in America today. Let us tell you more about it.

### MONEY SUNK IN ALTERATIONS

CONTINUED FROM PAGE 17

be recovered. Get this point straight from the field of value: you are making a mongrel out of your job when you indulge in alterations to any great extent.

Alteration should be called "Cash Depreciation." In many cases it is that, with the chances of resale favoring the unaltered original.

Alteration is down for the count, but counting up points I really find two scores that can be chalked up to the credit of alteration:

One where extra spring leaves permitted a heavier load with safety and thus gave immediate returns in tonnage hauled.

Two, where oversize rubber was installed and gave double mileage.

The safe alteration rule to prevent loss is shown in both scores which favor alteration. Make sure of a double return on all expenditures involved. Profit begins after twice the cost of alteration is secured. Haven't I made it plain how you give away or lose track of the first cost in the market? And what trucker has not heard the familar words: "Too bad he spent the dough that way; he'll never come out on it." This expression is prompted, of course, by the feeling that no increase in market value is accomplished.

### Factory Alteration

HE production line rolls forward, and each new truck passing a certain point is given a serial number. At this very moment its existence is established. This is the birth certificate. The identification of all the parts in the car are connected to this number. To doubly identify it the engine number accompanies it. When factory alteration of the car is decided upon it is announced that beginning with a certain number such and such change becomes standard. This kind of alteration costs the buyer little or nothing at all, and sometimes the same car is offered after an alteration of considerable outlay, for even less money. As for example, trucks one year without starting and lighting sold the following year fully so equipped at no increase in price. Here is the point: Alteration before the chassis receives its birth certificate (the serial number) is not counted against it, and hence not a burden to the buyer.

For the past four years especially

has this been true. Bumpers, tirecarriers, windshield wipers, oil filters, cabs, starting and lighting outfits, along with optional ratio for gears in transmissions and differential, are among the host of alterations made at the factory besides a general trend toward better material throughout. But get one of these jobs that came off the line without something you think should be on it and then try to get it. I'll say you'll pay for it.

There should be no doubt in your mind today as to where the proper place is for alteration. Facts on record show that alteration during the years from 1912 to 1925 in the field in many cases was very satisfactory. Remodeled and rebuilt jobs during those years by the hundred were turned out which show a good return on the money invested. But the present is something else again.

The conclusion of the matter for alteration is or seem just this: The shelves of books showing designs and construction prior to 1926 fade and become of little value with the onrush of advancement since this date. Pages and pages of engine alterations become not worth the mention. Therefore, Mr. Owner-Operator, compel the truck salesman who takes your order for a truck to honestly help you get one that fits the job you have for it. Write it off in the shortest possible period, and thus entrench yourself for further advancement by being ready to keep pace with progress as often as circumstances demand it. If, on the other hand, you discover a mistake has been made and find yourself the owner of a misfit, don't sink money into expensive alterations. You'll find it more to your advantage in this day to refinance the account, take the best deal and start again. Sounds tough but certainly much better than having two trucks tied up in one and that one an old one.

### What Holds the Rear Axle On?

directions and so keep the wheels on without depending upon the axle shafts.

With this type of wheel mounting there are two ways of connecting the axle shaft to the wheels. In one a toothed clutch, composed of a plate fixed to the shaft, that looks like a gear because it has a set of false teeth fitting into grooves in the inside of the wheel hub, is used. In the other design a flange is formed on the end of the axle shaft, or is attached to the end of the axle shaft in some manner and this flange is bolted to the wheel hub. The Society of Automotive Engineers' definition of a fullfloating axles states that the axle shaft is relieved from all strains except torsion, which is the driving stress. On a full-floating type axle the wheels will stay on and the vehicle can be towed even though both axle shafts are broken. Now in the four-wheel drive trucks, and with six wheelers . . . . "

But at this point Mac interrupts us. "Sorry, Den," he says, "I know you'd like to keep on talking about this all night, but I've got to start for home. Otherwise, I might become full-floating before I want to."

With a sigh of relief we rose to bow the gentleman out of our editorial sanctum (one desk, two chairs—and five waste baskets). "Sure am glad that you have found out everything you wanted to know about trucks, now, Mac," we conclude.

But in our hearts we knew he had hardly started yet, and that it wouldn't be many days before he'd be back again asking questions about something else.

He was.

### Tires Need Nursing for Mileage Health Continued From Page 50

pleted an arrangement whereby its tires would be regularly and thoroughly serviced. The resulting tire performance down to 1929 is interesting. During the period the number of road delays have decreased as follows: 254, 106, 54, 27; number of minutes delay: 4470, 1987, 1067, 610; while mileages have increased from 1,852,318 in 1926 to 3,254,591 in 1929. These figures tell the story of savings without further discussion.

A driver of the Atlas Storage Co., Philadelphia, took great pride in the condition of his vehicle and made it a point to include tires in his regular inspections. He checked air-pressures and tire condition religiously. His labors saved his company about \$1,000 in one year.

Another Philadelphia company spent \$40 for small repairs during the life of a set of 34 x 7-in. tires on a 2½-ton truck used in long distance van service and succeeded in getting from 26,000 to 36,000 miles from each tire before it was discarded.

# Your own cost records will tell you!

Write into those records of costs per ton-mile all those variable items of man efficiency and labor turnover—and then notice

how emphatically your records focus attention on brakes. Industry calls for greater and still greater load capacities, and for ever higher speeds. Distribution is in a hurry!—and the

### SHOP SPECTATORS— PEST OR PLEASURE

CONTINUED FROM PAGE 15

tough, but it ain't got nothin' on bein' a mechanic."

"There's certainly nothing pleasant about being watched while working," I consoled him, "and it does seem to me that something ought to be done about it. Maybe nothing can be done, but at least I'm going to do a little investigating and maybe I'll come up with a good yarn for COMMERCIAL CAR JOURNAL. So long. See you fellows in church some time—I hope."

The investigation got under way immediately and the experience and views of a score of trade executives in a dozen states were solicited and received. Analyzing the views it was found that mechanics had a wellfounded complaint but that various circumstances compelled some dealers to disregard the feelings of their employees and consider only those of their customers. Other dealers, it was found, adhere to a no-admittance policy with well-guarded exceptions, while still others, admitting that customers should be kept out of the service shop, raised a lot of "buts" that certainly must be taken into consideration before deciding upon a policy. Fortunately, some of the men even had ideas about how to keep the shop clear of spectators.

So that, all in all, the investigation proved the subject "Should the customer be kept out of the service shop? If so, how?" was a good one for editorial treatment because it constituted a problem in solving which the trade was divided into different camps. A clarification of issues, therefore, is in order. Let us first take up the conscientious objectors to customer exclusion.

### • Shop Isolation •

N Chicago, where I had as high as 150 trucks under my direction constantly, I had a workshop on the second floor, and I kept the public out of there rigidly," said L. D. Hemmon, of L. D. Hemmon Motors (G.M.C.), Phoenix, Ariz., in prefacing his views. "The service shop in a large city should be provided with a central booth in the drive-in room where the order sheet may be made out immediately. Then some barrier should be erected through which the public may not pass after the truck has been taken beyond it. Preferably, I should say, on a separate floor. Here in Phoenix, a city of less than 100,000, I find conditions very different. We are located in the middle of a block, and if a man walks through the salesroom and the shop to get to the alley without going around the block, he's welcome to do it. Perhaps as many as a half dozen may do it in the course of a day. Customers go into the shop at will. It's partly the spirit of the place and partly the size of the town, but I would consider it bad business to make any effort to change this. In fact, mechanics often make good contacts with drivers."

### • Theory and Practice •

HEORETICALLY, the customer ought to be kept out of the shop," observed E. F. Nygaard, manager of the truck department of the J. M. Opper Co., Omaha, Neb. "In practice, no. And we don't try to keep him out. It is his truck and he has a right to be with it if he wishes. We work on the hourly basis, and if the customer sees the work being done it seems to lessen any objection to the bill presented later. If he sees two men busy at the job that lasts an hour, it is not hard to convince him that there were two hours of labor, whereas if he were barred from the shop he could have no clear conception of what was going on. The open shop for the customer inspires him with confidence in the workmen, the equipment, and the quality of the job."

In expressing his view, H. L. Smoots, sales manager of the Federal Truck Sales Co., Birmingham, Ala., said the average commercial car owner knows more and can be trusted not to allow the shop work to worry him. Sometimes his knowledge of his individual vehicle is even a great help. Therefore it is not necessary to keep him out of the shop.

"It hurts business to keep them out," was the practical observation of A. W. Marksheffel, president, Marksheffel Motor Co. (Dodge), Colorado Springs, Colo. "We find that if we have mechanics who know their work they don't get nervous when someone is watching them."

"We go over our entire territory regularly," said Otto Budke, service manager, White Truck Sales Co. of Arizona, of Phoenix," making personal calls in search of service business. It is a big factor in our sales total. If we can increase either the service or the business by having a customer

walk in here and browse around, it's easier than to have to travel the length of the Apache Trail to meet him. The barriers we have about in our plant are meant not so much to keep the customer out, as to keep the attendants in. The workshop is shut off by a light wire netting, but the big doorways have no doors on them. The hint is sufficient."

Frank B. Smith, president, F. B. Chevrolet Co., and W. O. Strausbaugh, president, Strausbaugh Motor Co. (Dodge), both of Youngstown, Ohio, reached the unanimous conclusion that one of the best ways of getting and holding service business is to take the customer into the shop. Both feel that their chief competitor is the little alley shop which has few tools and has to take so much longer at a given job that his ultimate charge is higher than that of the well-equipped shop.

"'See how we do it' is the slogan of our service department," Mr. Smith declared, and Chevrolet car and truck drivers and owners are invited in order that they may be impressed with the facilities provided.

### Obstacle Method

HERE seemed to be decided agreement among those favoring exclusion of customers from the shop that this can best be accomplished by setting the service department apart from the rest of the business. Not in another part of the city, but on the second floor, or third floor, for instance, or even on the first floor but so separated by partitions and entrances that it cannot be seen by customers on entering. Those subscribing to this remedy were George F. Wroten, of Wroten-Hundley Motor Co. (Dodge), San Antonio, Tex.; R. W. Leach, vice-president, Curtis Auto Co. (Reo), Milwaukee, Wis.; J. T. Jenkins, truck department manager, J. B. French Co. (Dodge), Oakland, Calif.; S. A. Stephens, president, S. A. Stephens, Inc. (Dodge), Buffalo, N. Y.; M. H. Clark, general manager, Milam Chevrolet Co., San Antonio, Tex., and R. E. Davis, general manager, O'Brien-Davis Auto Co. (Dodge), Omaha, Neb.

"In my opinion," Mr. Wroten also said, "an owner should never be permitted to go into the service department where his trucks are being repaired unless he has expressed a desire to visit the service department. If he makes such a request, no doubt he has some specific reason, and then you will be doing him a courtesy in permitting him to enter. Trucks for repairs should be received in a court of some character. The work to be done should be ascertained by an experienced man who should also be a

Into the motor car and truck of today is built a precision and dependability gained thru years of ceaseless endeavor in automotive design and construction... From it emerges new brilliancy of performance! VISCO-METER pledges to protect and prolong this performance.

### A Scientific Basis for Lubrication

Visco-Meter is entirely new to motordom, yet upon the function of this important device depends the life of any motor. Rightly called "the watchdog of lubrication", Visco-Meter analyzes the motor oil under actual operating conditions and reveals its exact lubricating value (viscosity) for every minute of every mile.

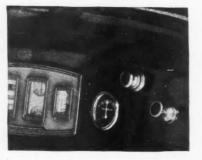

Guesswork ends! Instead of attempting to check oil by mileage readings, the driver has merely to

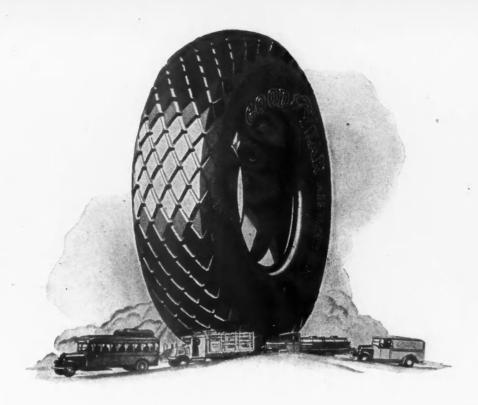

glance at the dial on the instrument board to know at once the lubricating quality of oil being supplied to bearings and cylinder walls. A lubricant which is too thin or of incorrect grade is instantly revealed ... Visco-Meter also warns instantaneously of all lubrication disorders: clogged lines, leaks, faulty oil pumps, low pressures, insufficient oil.

### Pays for Itself in Oil it Saves

Visco-Meter enables each driver to get maximum mileage safely out of every quart of oil! This new device is substantially built and never needs servicing. Completely illustrated directions make installation easy. Dial can be attached to dash or to steering column. Send coupon for full details. Visco-Meter Corporation, 316 Grote St., Buffalo, N.Y.

### DON'T PASS UP

### the greatest trucking help of the year!

It was a big event for truck owners when Goodyear developed truck balloons.

Now that trucks are built for speed, these newest Goodyear Tires deliver all the advantages to trucks which balloon tires brought to passenger cars.

Because they absorb jolts, they protect the truck mechanism—reduce vibration—bring down maintenance and repair costs. They protect the load from jars—they enable trucks to cover more miles per day, make more deliveries per day, because they travel faster, hold the road on curves, and provide greater traction on or off the pavement.

And beyond all that, these new Goodyear Truck Balloons make the tire cost per mile lower than it has ever been under similar operating conditions. They stand up under the heat of fast driving—they

make punctures even scarcer than they have been before they roll softly over bumps that would break down many a high pressure tire.

When you get balloon tires for your trucks, get Goodyears. Goodyear pioneered and perfected truck balloon tires—and Goodyear Truck Tire Service Station Dealers have the advantage of the greatest balloon truck tire experience in the tire industry.

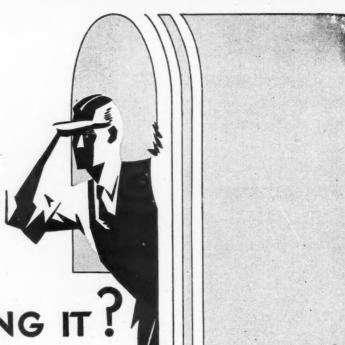

On your new trucks, specify Goodyears

# OVER SNOW-COVERED ROADS SINCE 1913....

Champion Snow Plows are the oldest and most complete line of snow removal equipment, for motor truck attachment. Widely used by state, county, city and town highway departments, railroads, industrial, and transportation companies, they offer truck dealers an unusual opportunity for winter business.

These same customers are winter truck buyers. Your aggressive sales effort may place you in a position to recommend "Good Roads" Equipment. A line of snow plows for every snow-removal condition. Plows that fit small as well as heavy duty trucks. Plows with every modern engineering improvement. Plows that operate with less effort, more economically. There's an extra profit for the truck dealer who helps sell "Good Roads" Equipment. Write for selling arrangement.

### SHOP SPECTATOR— PEST OR PLEASURE

CONTINUED FROM PAGE 54

salesman. Then the truck should be sent to the service division for final instructions for repairs."

"The customer should be kept out," declared Mr. Leach, "and the Curtis Company is handling this very well by having the service receiving room on the first floor and the service shop on the third. No one can get into the service shop without a pass. It has been found that if truck drivers are permitted in the shop they will take up much of the serviceman's time and the job will cost the driver's employer more than it should."

"The question is a difficult one to solve," admitted Mr. Jenkins. "The customer should be kept out as much as possible. His presence, especially if he insists on talking, demoralizes the mechanic and interferes with business. But we are forced to make an exception in the case of the customer who wishes to see what is being done to his truck. Most mechanics do not want an outsider hanging over them and they cannot do their best work under such conditions, but on the other hand many owners insist on seeing what is going on in their truck. However, a skeptical owner who has been allowed behind the lines once or twice to see the work he ordered and will pay for is being conscientiously done, soon will acquire confidence in the mechanics and the dealer, and will not want to go in. Our shop is three floors away from where the trucks are checked in, and that helps a lot."

### Inaccessible

HEY certainly should be kept out," Mr. Stephens said without hesitation. "Our service department is on the third floor. We have a service salesman. As a truck is run in for service, he steps up to the driver with a blank, fills out the necessary information for repairs, and calls a man who puts it on the elevator, unless it is a quick job which can be done on the main floor. The driver of the truck never gets as far as the elevator. We provide a comfortable waiting room near the service entrance for those who wish to wait, otherwise the service salesman calls the owner or driver on the phone as soon as work is finished. It is essential to us, in a shop which must run with extreme efficiency in order to get out the work, to keep owners and drivers out of the service department. In order to get up there owner or driver must have a pass."

"Customers should be kept out of

the service shop but this cannot be done on the whole," in the estimation of Mr. Davis. "Our shop is on the same floor as the service area but with a wall between through which is the driveway. This is closed as much as possible. Operation of this door is by electricity. Then there is a sign of 'No Admittance' at the entrance. The caution stops some of the visitations but not all. Some customers are bound to follow their truck through the door into the shop, and it would be poor policy to eject them. The chief objection to customers watching work done on the truck is in the fact that they cannot as a rule understand the charges made at flat rates on repairs that with skilled workmen and highly modern machinery and tools are quickly dispatched. In that case they are apt to object to amount of bill."

### No Admittance

HE Mack branch at Milwaukee has little trouble in keeping owners and drivers out of the service shop. The receiving floor is large and just off it is a room for the drivers. The shop is shut off by a large gate and entrance to it is through a door on which the "No Admittance" sign is painted.

"Customers should be kept off the service floor," said C. C. Morgan, manager of the branch, "because they take up much of the mechanics' time, and there have been instances where tools have been taken by drivers. The mechanics do not want the customers or the drivers in the shop. While the rule is that no one must be admitted to the shop, there are exceptions to it. If a driver is in the shop for only a short time, he is permitted to stay there, but if he stays too long, he is brought into the office and told of the situation and of the rule. We try to show the customer and the driver that by his being on the service floor and conversing with the mechanics, his job in reality is costing him more because of the time lost by the serviceman. There are times when we must take the customer into the shop to consult with him about the service job, and show him what we think should be done."

Ralph J. Rieman, president and general manager of Kam-Rieman Co., Inc. (G.M.C.), Buffalo, N. Y., looked at the matter from the standpoint of the city dealer and of the dealer in the smaller localities.

"Customers should be kept out but I haven't discovered any way of doing it," he reasoned. "It is possible in the big shops but I do not see how it can be done effectively in a medium-size or small shop. Some owners are not fussy about repairs on their personal car, but they expect a truck in their business to go on forever without repairs, so that when a driver reports need of repairs this type of owner follows it up carefully."

While opining that customers should be kept out, T. E. Swain, manager, Reo Motor Car Co., Oakland, Calif., said: "In our place we have the shop on the same floor as the balance of the plant and we can't really keep them out. There are two reasons why we cannot enforce the rule strictly: we cannot offend the customer, and we cannot let him think we are hiding anything from him. Sometimes it is necessary to take the customer into the shop and discuss something about his truck with him, but we don't permit him to go in and sit on the running board and talk things over with the mechanics. The mechanics are instructed not to talk unless they have been asked a definite question. Truck owners who drive their own trucks are the hardest to deal with in this respect. Often they want to discuss methods of operation and kindred topics and there must be some leeway, but the whole situation must be handled very diplomatically."

The C. H. Wells Co. (Chevrolet), Seattle, Wash., enforces a strict "No Admittance" to the shop. Should there be cause for an exception, explained T. H. Kirksey, in charge of truck sales, the visitor is accompanied by the shop foreman. This eliminates the evil of the practice and reduces the time spent in the shop by the customer to the minimum. Adherence to this rule does not react unfavorably when universally enforced.

### Moral Effect ●

By all means customers should be kept out of the service shop," said C. E. Anderson, sales manager, General Motor Truck Co., Birmingham, Ala., "but just how it is going to be done successfully I am not prepared to say. I believe it is well to exclude the customer from the shop as nearly as possible because of the psychological effect upon the customer himself. Just as it is better for an ill patient not to know too much about his condition and exactly what variety of treatment he gets in the operating room, so is it better for the truck man not to see his vehicle when it is dismantled and undergoing repairs. It upsets his ideas of the capabilities of his truck unless he is a really experienced mechanic."

FOR SEMI-TRAIL because

# HORIZONTAL CUSHIONING Eliminates jars in coupling, starting and running ...ASK USERS...

Relay starts the trailer before the rear wheels of the tractor, and the load of the trailer helps start the driving wheels smoothly, and with added power. Too, this horizontal flexibility between trailer and tractor saves over half the shocks of running. And it allows smooth, gradual coupling, without the usual slam and jar.

and tires are a big item in this service -

. ASK USERS . .

The tires on Relay tractors hug the road because Relay cushioning reduces bounce and scuff. This greatly adds to the mileage. The increased traction on Relay driving wheels also reduces slide, spin and skid – another vital saving in rubber.

# Per Average mile Why Relay Saves 3

HE Relay Drive does horizontally what the springs do vertically. The load instead of being rigidly fixed above the center of the rear wheels is free to swing pendulum-like below the wheel center. This horizontal oscillation reduces the shocks retard the vehicle; and gives greatly added traction. Use of the of travel approximately one half; uses the load to help propel and oscillating drive reduces tire costs one-third, fuel cost a tenth, and depreciation and maintenance costs one-fourth each, giving an average saving in the total cost of transportation of 3¢ per mile.

tire mileage 68% greater than with conventional trucks. By infered over normal roads at normal speeds are shown to be reduced The results of a questionnaire to 300 Relay owners show actual terposing a horizontal defense against road shock, the impacts sufapproximately one-half. If a conventional truck has a life of 4

WAGES PROFIT 34

pacts result in reduced crystallization in all moving parts. This rethird greater, or  $5\frac{1}{8}$  years. The lowered imwill have a life one-

years, the Relay truck

duction gives an average saving in repairs amounting to more than a third. These lessened road blows naturally benefit the cargo as dition of milk, furniture, flowers, etc. are the results. A truck that well as the truck. Less breakage of perishable goods, better con-Speed need not be lessened because of rough going. More time is can negotiate difficult road conditions gives added daily mileage. spent on the road thus further increasing average mileages.

The savings with Relays have been proved by the experience of nundreds of owners, -3¢ per average mile.

# COMMERCIAL CAR JOURNAL AND OPERATION & MAINTENANCE

Corrected Each Month From Data Supplied Direct by Manufacturers

(KEY TO ABBREVIATIONS ON PAGE 80)

SPECIFICATIONS of the new line of Dodge Brothers trucks, described on page 34, and of the new Studebaker models, which were described in the August issue, are listed in tables this month. Other models added to tables in this issue are:

Brockway; 141 21/2-ton.

CORP. Lima,

Indiana: 141 2½-ton, 220 3½-4-ton.

Fisher Standard; Super 6 3½-ton, 150-A six-wheeler.

FWD; Sno Special 4-ton, M5 5-ton, M7 71/2-ton.

Gramm-Bernstein; J 11/2-ton.

International Harvester: A-6 3-ton, tractor-trucks AL-3, A-6.

Maccar; 86A 5-ton.

Paige; 1500 lb.

Stewart: 40X 11/2-ton.

Walter: tractor-trucks FBD, FBRD.

H. H. Burdick, Advertising Dept., General Motors Truck Co., Pontiac

A. G. Crockett, Sales Promotion, Mack Trucks, Long Island City, N. Y.

B. W. Wilkins, Engineering Dept., Reo Motor Car Co., Lansing, Mich.

The unquestioned trust which the truck industry places in this Table of Truck Specifications is due to the splendid collaboration of men at the factories who each month correct the statistical data and keep it up-to-date. For their valued cooperation in making the data authentic the Commercial Car Journal makes this acknowledgment of gratefulness and knows that those who make use of the Table will Join in saying, "Gentlemen, here's to you!" (Next month the tribute will be extended to another group of collaborators.)

### KEY OF REFERENCES

#### GENERAL

Gross Vehicle Weight—Chassis weight, plus body and cab, plus pay load. Chassis Price is for truck with standard wheelbase listed and with tires listed F.O.B. factory, unless other-wise specified.

R-Balloon —Dual Balloons standard equipment. P—High Pressure Pneumatics standard equipment.

DP—Dual High Pressure Pneumatics standard equipment. S—Solids.

DS-Dual Solida

eumatics furnished at extra cost.

### ENGINE Make

Bud-Buda Company. Con-Continental Motors Corp. Has—American Car & Fdy. Co. Her—Hercules Motor Corp. Lyc-Lycoming Motor Corp. Wau—Waukesha Motor Co. Wis—Wisconsin Motor Mfg. Co.

### Valve Arrangement

H—In head. L-"L"—Head. -Sleeve T-"T"-Head.

### Camshaft Drive

C-Chain

### Piston Material

-Aluminum alloy. C-Cast iron. N-Nickel iron

S-Aluminum alloy with strut

### Oiling System

CC—Pressure to main, connecting rod and camshaft bearings.

FP—Pressure to main, connecting rod, camshaft bearings and piston pins. PC-Pressure to mains and connecting rod bearings.

PG—Pump, gravity and splash.
PS—Pressure with splash.
SP—Circulating with splash

### Governor

Bf-Bethlehem Fabricators, Inc. Bu-Buda Co-Continental Ha-Handy Governor Co. HS-Amer, Car & Fdv. Co. KP-Handy Governor Co. Mo-Monarch. No-Not supplied. On-Own Op—Optional.

Pe—Pierce Governor Co. Si—Simplex (Elsemann Magneto Corp.) St—Sterling. Wa—Waukesha.

### Radiator

Bus-Bush Mfg. Co. Chi—Chicago Mfg. Co. Fed—Fedders Mfg. Co. G&O—G & O Mfg. Co. Har—Harrison Rad. Corp. Hex—Hexcel Rad. Co.

Lon-Long Mfg. Company McC-McCord Rad. & Mig. Co. Mod-Modine Mfg. Co.

Per—Perfex Corp.
R-T—Rome-Turney Rad. Co.
You—Young Rad. Company.

### FUEL SYSTEM Carburetor Make Car-Carter Carburetor Co.

Joh-Johns Mar-Marvel Carburetor Co. Sch-Wheeler Schebler Co. Ste-Detroit Lubricator

Str—Stromberg Motor Dev. Co.
Til—Tillotson Mfg. Co. -Zenith-Detroit Corp

#### Fuel Feed

E-Electric Pump G—Gravity.

M—Mechani P-Pressure.

### **ELECTRICAL SYSTEMS** Ignition System, Generator and Starter Make

-Amer. Bosch Magneto Co. P-Ro-Robert Bosch Magneto Co. Apo—Apollo Magneto Corp.

D-R—Delco Remy Company. Fig. Elsemann Magneto Corp. L-N—Leece-Neville Co.
N-E—North East Elec. Co. Spl-Splitdorf Electrical Co. 1—Generator and Starter at extra cost.

2—Starter not supplied. Generator at extra cost. 3-Starter at extra cost.

### CLUTCH

### Type and Make

D-Multiple disk. dp—Double Plate.

O—Plate in oil. P-Single plate.

B&B-Borg & Beck Co.

B-L-Brown-Lipe Gear Co.

### Make

a General Motors Truck Models shown are basic chassis in the ton-range clasa General Motors Truck Models snown are basic chassis in the ton-range classifications as advertised. Each model is available in a number of wheelbases and tire types (tire combinations—each type carrying a recommended gross weight) and priced accordingly. Gross vehicle weight indicated for each chassis in table is the recommended gross weight for type number specified without exceeding rated capacity of tires. The tire size does not affect the Straight Rating for which chassis capacity of tires. The tire size does not affect the Straight Rating for which chassis is guaranteed and each Model is designed to operate satisfactorily under average conditions with loads giving a total gross weight (chassis, body, equipment and payload) equal to Straight Rating given below. Type numbers, Straight Rating and Payload Range, assuming nominal body allowance, for each model follow:

| MODEL | STRAIGHT<br>RATING | TYPE<br>NUMBERS | RANGE OF<br>PAYLOAD<br>(TONS) |
|-------|--------------------|-----------------|-------------------------------|
| T-11  | 3800 lbs.          | 1001            | 16                            |
| T-15  | 5400 lbs.          | 1501 to 1503    | 34                            |

EATON-LITES
EASY-ON CAPS

THERE are forty-two car manufacturers and twenty-six truck and bus builders who equip with products made by Eaton interests. - - - This is a significant indication of a universal unwillingness to compromise with Quality.

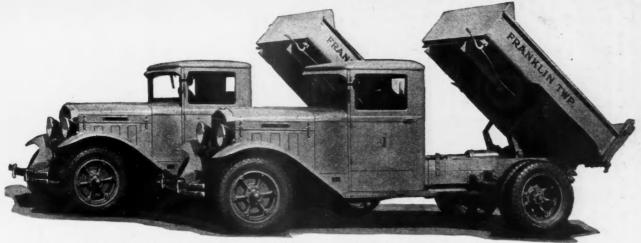

### EATON AXLES

THOSE interested in the manufacture or use of commercial vehicles will find it worthwhile to discuss their axle problems with Eaton. Data and knowledge gained through intimate contact with the automotive industry since its pioneering days aid Eaton in being of real service to those granting the opportunity.

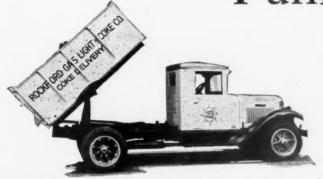

THE EATON AXLE & SPRING COMPANY CLEVELAND, OHIO

Part of a fleet of Diamond T Trucks with 1½ cu. yd. bodies, equipped with Model 4UBS St.Paul Underbody Hydraulic Hoists for Franklin Township, Pennsylvania, by The Schnabel Co., of Pittsburgh, Pa.

### Punishment Takers

International Model A4-145" W. B. with 2-ton coke body Equipped with 5UB St.Paul Underbody Hydraulic Hoist for the Rockford Gas, Light & Coke Co. of Rockford, Ill. by Farrell Mfg. Co., Joliet, Ill.

If you have a new truck or an old truck, a heavy truck or a light truck—there is a St.Paul Hoist for it.

Many a boxer takes the count because he can't stand the punishment of a hard bout. Dump trucks take a lot of punishment, too. And the business end of a dump truck is the hoist. St.Paul Hoists have been trained for years in the school of hard knocks. This has resulted in many exclusive features being built into St.Paul Hoists which, combined with their rugged strength, economy and ease of operation, have earned for them in every class from light to heavy weights the undisputed title of champions.

### LECO AUTOMOTIVE PRODUCTS MANUFACTURED BY THE CLEVELAND PNEUMATIC TOOL CO., CLEVELAND, OHIO

# NLY GENERAL HAS THIS Patented Truck-Balloon Construction

Eliminates Excessive Heat • • the Major Cause of Blowouts and Premature Wear • • • • •

It is *heat* that causes most tire failures—*heat* generated by internal friction. At 200° a tire loses 25% of its strength—and a 12-ply tire is reduced in reality to only 9 plys. At 300° the strength loss jumps to 50%.

General's patented truck-balloon construction eliminates this excessive heat and maintains maximum tire efficiency on the toughest jobs. The Jumbo Truck-Balloon is cooler running than any other tire—proved with actual thermo-couple tests by impartial scientific bureaus. This principle, exclusive with General, means greater strength, slower wear, freedom from breakdowns—mileage increases as much as 350%.\*

Thousands have changed over. In every class of service, from light express to the biggest heavy duty jobs, the General Truck-Balloon is piling up records of savings that challenge any comparison.

Your General Tire dealer has actual operators' records proving what it will do on your particular type of job. His complete Truck-Balloon line includes a tire to replace every high-pressure size without "lay-up," delay or anything "makeshift." He can change over trucks from solids in two hours or less! Get his quotation today. The General Tire and Rubber Co., Akron, Ohio.

### DAY-ELDER SUPER-SERVICE-SIXES

The eleven new Day-Elder models range from the fast 1 ton truck to the extra-heavyduty 12 ton six-wheeler. In the modern world of transportation, the truck must answer to more severe tests of speed, strength and load-ability, than ever. More rigid than any of these tests are the standards by which Day-Elder trucks and buses are built—achieving glowing records that have written themselves high on the scrolls of modern business service.

Day-Elder Super-Service-Sixes not only LOOK modern—they ARE modern by every 1931 measure of performance. Skilled engineering co-ordinating with the finest truck units, give these trim, handsomely modelled trucks the essential qualities that make for years of economical, satisfactory service.

### An Additional Feature--

### on the Precision-Built Motor Truck

Battery failure occurs so seldom that many men think they don't need to be protected against it.

—But, battery failure occurs often enough to prove that every user of Leece-Neville Voltage Regulation is making a profit on his smart judgment.

The purchaser of a new Precision-Built Motor Truck is given the privilege of specifying a Leece-Neville Voltage Regulator on his truck or bus as optional equipment at slight additional cost. Take advantage of this opportunity. If you aren't acquainted with Leece-Neville Voltage Regulation and how it protects your equipment, ask for details. The facts will interest you.

#### Voltage Regulation Minimizes Electric Maintenance

- 1 Battery cannot be overcharged.
- 2 The battery is charged only at the correct rate for its state of charge.
- 3 Battery will operate longer without requiring replenishing of electrolyte.
- 4 Life of battery greatly prolonged.
- 5 Lights can be operated direct from generator.
- 6 Loose connections will not cause lamp bulbs to burn out.
- 7 Makes most economical generator system.
- 8 Any Leece-Neville Voltage Regulated Generator can be used without battery.
- 9 Lamp life greatly prolonged.
- 10 Motor coaches fitted with Leece-Neville voltage regulated generators provide passengers with satisfactory illumination and safe transportation.

Economy, Reliability.

Specify Firestone Rims for all kinds of wheels-Wood, Wire, Disc and Cast.

The Firestone Steel Products Co., Firestone Park, Akron, Ohio

#### **FEATURES**

Drives through front and rear wheels, brakes on all four wheels.

Steers as easily as a pleasure car.

general service truck hich adapts itself to pecial needs and pro-des more than economes more than econo ical transportation.

Furnished in 2 to 10 ton sizes, including four wheel, six wheel and tractor trucks.

Manufactured by the oldest and largest manufac-turer of four wheel drive trucks in the world.

Have increased in sales 1084% in the past eight years.

Received 62% of 1929 orders from owners of FWD Trucks.

WD Trucks not only provide low-cost hauling over any kind or type of road . . . But they do more - They pull through mud and sand with capacity loads, and plough through snow when ordinary trucks would be stuck . . . this because of their FWD principle . . . each wheel is alive, power is delivered to each of the wheels, they have plenty of traction, extra power, putting every ounce to profitable work.

These advantages have made FWD's preferred for road building and year 'round maintenance, as well as for heavy duty in the oil, coal, lumber and other fields where economical performance is required . . . There are a few territories still open where FWD Dealers will be appointed. Perhaps you are in one of these districts. If you are, you can join this unusually profitable dealer organization. Write today for FWD's profitable dealer plan.

WIDE SERVICE

# New CURTIS-built TRUCK and BUS Lift!

WITH a lifting capacity of 20,000 pounds, and a platform length of 23 feet, this new Curtis Truck and Bus Lift will handle the heaviest and longest trucks or single-deck buses made.

It lifts the vehicle by front and rear axles, leaving the wheels hanging free for easy brake and wheel adjustments.

The Curtis Bus Lift is of a single-cylinder post type. It can be rotated to a full 360 degrees, which permits the vehicle to be driven forward both going on and off the lift. Installation cost is less and uniformity of lifting and lowering speed is assured.

The Curtis Truck and Bus Lift provides complete certainty of safety through:

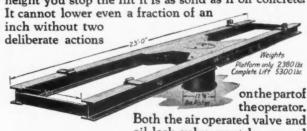

1. Tremendous structural strength — 400 to 500% safety factor provided in all parts. The plunger itself is 17% in diameter.

2. The electrically welded platform is made of tremendously strong H-beams, capable of standing five times the weight called for by lift's capacity.

3. All oil, no air in the cylinder. Being both lifted and locked by incompressible oil, at any height you stop the lift it is as solid as if on concrete. It cannot lower even a fraction of an inch without two

oil lock valve must be opened before lowering can start and neither of these controls are under the lift. The Curtis Lift is super-safe.

4. A safety retard valve automatically and positively governs the lowering speed.

5. A safety leg furnished without extra cost is an extra safety feature.

6. Elimination of fire hazard from heavy gasoline fumes in pits.

Complete details of this new Curtis Truck and Bus Lift are given on an illustrated data sheet now ready. Mail the coupon for it and ask for any other special information you would like to have.

### A Secret For

### That's Why American Brakebloks Cut the Cost per Stop

American Brakebloks are different! No other brake material is even similar.

Most materials, for example, are bonded (as they have been for years) by the only agents available: rubbers, asphaltums, phenol compounds, etc. - all of which ignite or soften at low temperatures. But American Brakebloks are bonded by a new, secret compound which changes to a solid and which cannot be softened or volatilized by heat.

And there is another difference, even more important. Most bonding agents are merely applied to the surface of the material after the manufacturing process is nearly completed. But the American Brakeblok secret formula is thoroughly mixed with the raw materials. Thus, the frictional efficiency of American Brakebloks is not dependent on penetration, but is built right into every particle of the material.

Think what this means to the fleet owner and bus operator! Now you can have a brake material which will not soften, swell, glaze or burn. Now you can cut the cost per stop! But be sure that you install the GENUINE American Brakebloks. Write us today for name of nearest jobber.

AMERICAN BRAKE MATERIALS CORPORATION Industrial and Automotive Division American Brake Shoe & Foundry Co. 4660 Merritt Avenue • Detroit, Michigan, U. S. A.

Sales Offices: Chicago · · New York · · San Francisco Export Department: 30 Water Street

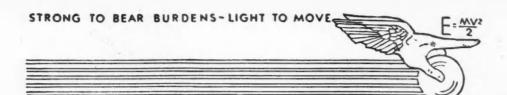

- American Brakebloks have no metallic content to cut or score brake drums.
- 3. They are NON-COMPRES-SIBLE,
- They are made to fit every existing brake assembly.
- 5. They have been adopted by more than 40 manufacturers of motor vehicles and brakes.

### Dead weight decreased 28%

The truck of today must pay its way. An efficient chassis loaded down with needless weight is no longer efficient. That is why progressive body builders and wide-awake owners find the light, strong Alcoa Aluminum Alloy truck body a major factor of maximum performance.

The Rieck-McJunkin Dairy Company, of Pittsburgh, has made its fleet of delivery trucks more than pay their way—with this modern body metal. Averaging 150 miles per day with a pay load of 144 cases of milk—the instal-

lation of Alcoa Aluminum bodies cut off 900 pounds of dead weight.

Alcoa Aluminum Alloy structures, weighing only one-third to one-half as much as steel, meet all requirements of safety, strength and durability. Truck operators in practically every field are daily proving the advantages of the light, strong Alloys of Alcoa Aluminum for truck bodies.

### Smooth...Smooth...Smooth

even at 200,000 miles

NEVER SCORE
At last! Release from scored, pitted brake
drums. Gunite Drums stay smooth and
true—all their life.

NEVER SHRED LININGS Worn drums mean torn, shredded linings. Linings last 3 to 5 times longer on Gunite Drums because they stay smooth.

SAVE ADJUSTMENTS
Worn drums throw brakes out of adjustment. Gunite Drums save labor and lost

SAVE TIRES
Grabbing, dangerous brakes! Gunite
Drums always give linings a smooth,
even braking surface.

ON city bus service... hardest of all tests for brakes, brake drums, brake linings... Gunite Drums have made and are making these outstanding service records—over 200,000 miles and still smooth—on busses averaging 5 stops to the mile!

How can Gunite Drums last so long? How can they escape scoring, and distortion in today's grinding, punishing traffic? Because Gunite is a special, secret-process metal whose very structure defies wear. Because Gunite gets smoother, smoother, smoother until its surface is almost like plate glass—under braking friction that would ruin an ordinary drum. Gunite Drums don't roughen. Their high carbon content makes them extremely slow to heat. Flakes of graphite evenly distributed throughout the metal does away entirely with any tendency to roughen or score.

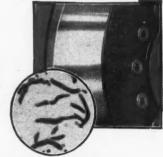

Get Gunite Drums for every bus or truck you own. They're available on new equipment—and for replacement on all but a few rare makes of vehicles. Hundreds of fleet operators swung over to the new Gunite Drums in the last few months. They'll solve all those brake drum troubles you've been having—and pay for themselves in saved linings alone. Ask for the new Gunite Catalog—sent free on request.

THE GUNITE CORPORATION
Rockford, Illinois

#### WHY GUNITE IS SMOOTH

GUNITE

In the circle is an actual microphotograph of the graphite particles scattered evenly throughout Gunite. With a pearlitic matrix similar to that of tool steel, Gunite is hard without the "stickiness" found in ordinary steel. That, in a nutshell, is why Gunite stays so hard and smooth under braking friction.

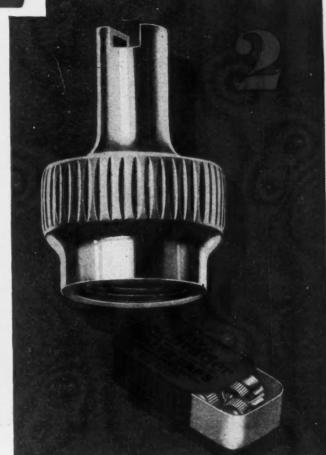

GUNITE BRAKE DRUMS

# ALERT DEALERS sell these products

### -for increased PROFITS

HERE'S a tip that's boosting profits for wideawake dealers. Try it yourself: Just glance at the tire valves of every car that comes to your place of business. In most instances you will discover one or more valve caps missing. There's your chance to sell a box of Schrader Valve Caps.

Simply tell your customer that a valve cap should be on every valve stem to protect the valve mechanism from dust and dirt, and that Schrader Valve Caps are guaranteed airtight up to 250 lbs.

This same customer is a good prospect for a box of Schrader Valve Cores, too.

Just explain that valve cores are bound to wear out in time. No mechanism, however sturdy, will last forever. Tell him also that a spare box of genuine Schrader Valve Cores is as necessary for emergency use as a spare tire.

One word of warning: Be sure the Valve Cores and Valve Caps you sell are genuine Schraders. It pays to be certain, for then you know that you are equipping your customer with the same good products that are used in more than 85% of all tubes made in the United States and Canada today.

Be sure it's a Schrader-Look for the name

Schrader

### Wall Street Gets Its Mikados Via Autocar

BREATHES there a man or woman of intelligence who has never written with a Mikado Pencil—leading product of the largest pencil factory in the world? » » » Two thousand people make Eagle Pencil Company products in Eagle's New York plant. Millions of people each year will see the new 6-cylinder, 2-ton Autocar Dispatch which makes Eagle deliveries to the stationery trade in Manhattan. » » Autocars, built to pace-setting standards of precision, respond with flexibility and stamina to the exactions of heavy, city traffic just as they respond with ruggedness and reserve to the strains of trans-continental travel. They are graceful of line, and lend themselves admirably to the accomplishment of the important advertising function that is notably a duty of the truck-about-town to its owner.

### AUTOCAR TRUCKS THE AUTOCAR COMPANY, ARDMORE, PA.

### Timken Bearings are Licking the Toughest Jobs in Industry—Hence their Vital Necessity in Motor Trucks

Sweeping on and up with an irresistible rush, Timken Bearings soar to greater and greater heights of achievement as they are pitted against the toughest jobs that Industry can produce... upsetting all preconceived ideas of production and production costs... revolutionizing anti-friction requirements... brushing aside old theories and traditions to make way for new standards of anti-friction efficiency, economy and endurance.

Terrific pressure loads such as are met in steel rolling mill service—as high as 7,000,000 pounds, are being carried by Timken Bearings in many of the country's largest steel plants.

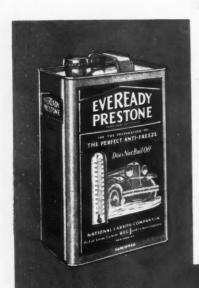

Hair-breadth accuracy such as is demanded by the finest precision machine tool work is maintained as a matter of regular daily routine.

And thrust and weight and shock—no matter how severe, are handled with equal capability and sureness whether encountered in such widely different types of heavy duty service as motor truck operation, paper mills, transcontinental limited trains, oil field equipment or any other kind of machinery.

Wherever wheels and shafts turn, "Timken Bearing Equipped" is the modern symbol of protection and saving.

You need and should demand Timken benefits in the truck equipment you buy. They are obtainable in most leading makes. The Timken Roller Bearing Company, Canton, Ohio.

### TIMKEN Tapered BEARINGS

# "...We have not had one broken radiator due to freeze-up."

-Bell Transit Co.

WHEN a bus or truck gets a frozen radiator, the loss is often twofold. There is the cost of repairs, and the cost of having a unit tied up...out of service!

That is why the Bell Transit Co., and thousands of other fleet-owners, have found Eveready Prestone a good investment. Because it gives positive security, and because one filling is all that's required for the entire winter, Eveready Prestone is economical to use. Compare its cost per car with that of any other permanent anti-freeze available.

You can prepare your fleet for winter at your own convenience, with Eveready Prestone. It won't boil off, or overheat an engine. See that cooling-systems are clean and tight... then a single filling makes your fleet safe for the season. Eveready Prestone is now green in color. Write for your copy of "Eveready Prestone Dealers' Manual."

The Eveready Hour, radio's oldest commercial feature, is broadcast every Tuesday evening at nine (Eastern standard time) from WEAF over a nationwide N.B.C. network of 31 stations.

BELL TRANSIT CO.

August 6, 1950

National Carbon Company 80 East 42nd Street New York, N. Y.

Gentlese

For the past three winters we have been using Prestone as an antifreese in all of our truck radiators, and we have found it entirely satisfactory.

We are operating twenty-two units doing practically all kinds of hauling, both local and long distance and since using Frestone we have not had one broker radiator due to a freese-up.

While the original cost is comewhat higher than some other antifreese solutions we find it good concey to use Prestone as for every freeze-up a truck is usually out of service the better part of a day. By distinsating these tis-ups we feel that Prestone is really worth the money.

Mr. S. Waller Bell Transit Co.

WW/90

## **EVEREADY**PRESTONE

THE

ONE-SHOT ANTI-FREEZE

# the Dual Wheel that gives you forced AIR CIRCULATION

...and greatest tire mileage

Nothing will ruin a tire so quickly as heat—arch enemy of tire mileage. In many cases brake drum heat has burned up 85% of the normal expected mileage of tires. No tire, no matter how good, can hold up long under such punishment.

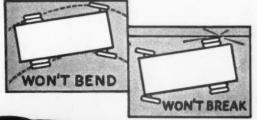

Truck and tire manufacturers agree that a speeding truck must have a cool running wheel. Brake drum heat is the result of increased speed and application of brakes. The brake drum shoots forth high destructive temperatures against the inside wall of the inside tire on a dual. The tire bead weakens and soon the tire must be replaced.

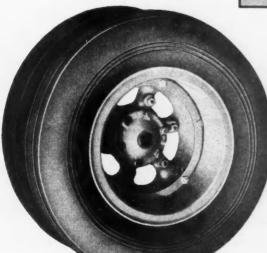

Dayton Duals effectively dissipate this heat. Note, in above cut, that by forced air circulation strong currents of air are continuously whipped against the brake drum, rim and inner wall of inside tire, where heat is greatest and most destructive. Only the Dayton Design can give you such protection against heat. Tires almost always give much more than their normal mileage on Dayton Duals.

Only a tire and rim are needed as a spare with Daytons. No extra wheel necessary. Daytons will not bend or lose their positive true alignment in the fastest and toughest kind of service. No wheel repairs. The first cost of a set of Daytons is the last and only cost.

and only cost.

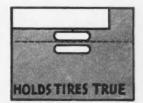

Distributors in principal cities throughout the country will give you quick, complete changeover service on Dayton Duals. Specify Daytons on your new trucks.

#### Dayton Brake Drums

are Superior in Strength and Wearing Qualities. The metal, made by a special process in electric furnaces, has an even distribution of graphitic carbon. Dayton Brake Drums last longer, stay smooth and save brake linings.

### THE DAYTON STEEL FOUNDRY CO., DAYTON, OHIO

We have acquired the Tigerloy Brake Drum Division of the Massillon Steel Castings Co., of Massillon, Ohio

Dayton
The Mark of a Good Wheel

There's danger at every turn of the road!

A real emergency brake is the best insurance you can buy. Even the most efficient service brake needs additional help in emergency. The TRU-STOP Emergency Brake is powerful . . . it will handle the load alone, if need be. It is more than a parking brake.

Because of the compound lever system, immense braking power is possible. Four brake shoes, two on each side, squeeze a flat braking disc which is mounted at the rear of the transmission.

Your buses or trucks can carry spare shoes, which can be installed by any driver in less than half an hour. Adjustment can be made on the road, also, if necessary, in a few minutes.

In order to take up the natural lining wear, two clamping bolts and one locking bolt are loosened, and the adjusting lever moved one notch.

## GOTFREDSON trucks reduce upkeep costs and breakage

Frames
Transmission shafts and gears
Rear axle shafts
Steering arm and knuckles
Steering knuckle pins
Worms
Piston pins
Valve tappets
(Nickel Chrome Iron in
cylinder blocks)

## with NICKEL ALLOY STEEL parts...

EIGHTY-FIVE per cent of Gotfredson truck buyers during 1929 were former users. This preference, based on experience, proves that these trucks are built to endure severe abuse and to assure minimum upkeep and repair costs—features which have been obtained by the use of high strength materials. The frames, gears, shafts, steering arms and other parts are made of Nickel Alloy Steels.

The Robert Gotfredson Truck Co. states: "We are of the firm conviction that although the first cost may be affected by the use of these parts, in the final analysis this is more than offset by fewer breakages and tie-ups...that by the use of Nickel Chrome Steel frames we are

increasing the life of our truck and reducing the cost per ton mile considerably. It is a well-known fact that a frame will deflect with each jar of the road. We have found that an ordinary carbon steel frame will eventually take a permanent set or fracture at the weakest point. We have yet to know of one of our Nickel Steel frames fracturing or setting; and as this is the foundation of any truck, we feel that the additional cost is justified."

Our technical files contain a wealth of data drawn from the experience of thousands of users of Nickel Steel in the automotive field. You are invited to communicate with us regarding your specific problems in the selection of materials.

Valve Seat Ring Tool \$79.50
Set. NET, complete

## SIOUX makes it easy to renew Valve Seats!

YOÙ can be sure of a neat and accurate job, when you use a Sioux Valve Ring Tool Set. An accurately cut recess and a tight drive for the valve seat ring is assured by exclusive Sioux features. The Sioux Expanding Pilot holds the cutter properly centered over the valve seat. The cutter is attached to the shank which rotates around the rigidly anchored pilot. No wobbling or traveling . . . no chance to cut recess oversize. Use Sioux Valve Seat Rings, made of special heat-resisting iron alloy—they stand the "gaff".

You can get a profitable price for valve seat renewing jobs as the car-owner is glad to save the cost of a new motor block.

Your Jobber Sells Them.

ALBERTSON & CO. INC., Sioux City, Iowa, U. S. A.

STANDARD THE

WORLD OVER

Here are 5 of a fleet of 21 dump trucks in Cleveland, all of which are equipped with Wood F-4C all-steel, hydraulic hoists of the new, improved, slant type, and Wood W-12 all-steel dump bodies of 4-yard capacity.

## FLEET OWNERS SPECIFY WOOD

Those who operate fleets of dump trucks are the most critical buyers of dumping equipment. That the majority of the world's fleet owners specify Wood hoists and dump bodies is the most sincere compliment to this organization's engineering and manufacturing ability.

The experience of fleet operation quickly tells the worth of a hoist or body. As a result, fleet owners purchase dumping equipment, not on a basis of first cost, but on a basis of profit-producing service.

They are quick to appreciate improvements that mean greater profit from operation.

Their purchases of the new Wood improved slant type all-steel hoists, and the modern Wood all-steel dump bodies is sufficient approval of the worth of these units.

The policy of many individual-unit operators, who buy Wood dumping equipment on the strength of the fleet owner's use of it, also has shown that it is a profitable practice to be guided by their choice.

Send for illustrated bulletins describing Wood Dumping Equipment.

WOOD HYDRAULIC HOIST

& BODY COMPANY

BRANCHES AND DISTRIBUTORS IN PRINCIPAL CITIES

E CONOMICAL operation is the primary consideration of the fleet owner. That is why, in specifying fleet equipment for numerous units, the modern fleet owner looks for equipment to give him performance that is uniformly efficient, uniformly dependable. The modern fleet owner has learned that this uniformity of performance is the chief factor in operating economy.

And he finds in Willards—a uniform and unvarying high quality of construction, a constant dependability in operation. These are the sound reasons for his choice—and the reasons why so many fleet owners specify Willard batteries.

# Truck Operating and Maintenance Costs

and their relation to the vehicles you are selling

WHEN the operator puts one of your vehicles into service, Mr. Dealer, you confidently hope that his organization, methods and experience are such that the vehicle can be expected to render the utmost efficiency.

If it doesn't perform as he expects from the standpoint of economy, it's a direct reflection upon the dealer and the product he represents.

This is invariably the case when the operator has no reliable cost-keeping system or methods.

Insure yourself against such dissatisfaction by recommending to your customers the

## COMMERCIAL CAR JOURNAL and OPERATION & MAINTENANCE Standard Cost System

Thousands of operators throughout the country have installed this system —many dealers ask their customers to use it.

It is simple—but 2 forms are used—a driver's daily route and a monthly summary sheet, and the cost is but \$9.50.

The complete system consists of

- 500 Driver's Cards
  - 60 Monthly Summary Sheets
- 1 Complete Instruction Booklet
- 1 Binder

# Handy Governors Have kept our trucks out of the repair shop"

"In studying our delivery problem, we found that excessive truck repair costs and accidents were due entirely to too much speed. We installed Handy Governors on three of our trucks as an experiment. After watching these trucks for several months, we ordered Handy Governors installed on our whole fleet. These Governors have reduced our truck maintenance costs, they have kept our trucks out of the repair shop, and they have reduced our truck accidents to a minimum. Our salesmen have still been able to make deliveries on schedule."

ALBERT GORDON for Gordon Bread Company

Los Angeles, Cal., April 3, 1930.

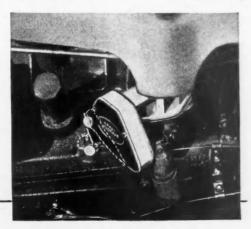

Steadily the evidence accumulates. Handy Governors ARE cutting delivery costs for the baking industry. They DO keep trucks out of the repair shop, and running sweetly on the job. THEY DO INCREASE OWNER PROFITS.

President Gordon's own story of the Gordon Bread Company's Handy Governor experience needs no elaboration. Read it. Ponder it. Remember that every day a truck spends in the shop costs you more than the Handy Governor th

And don't overlook Mr. Gordon's closing paragraph. Surprising though it may be, high speed actually retards deliveries. Governed speed expedites them. Especially is this true of Ford and Chevrolet fleets.

Let us put you in touch with a nearby distributor. He will tell you the whole story.

## Waukesha had a Bearing Idea!

They designed an engine to take an extra large overstrong center bearing . . . a bearing to stand the drive from adjacent pistons, to stand up under the double load, as compared to the other bearings.

That Waukesha engineers gave intensive study to bearings . . . load, wear, stress and strain . . . and then placed their bearing orders with Federal-Mogul, tells a big story about Federal-Mogul.

The more closely an engineer studies bearings, bushings, and bearing metals, the more certain he is to come to Federal-Mogul, for he receives by all odds the best engineering cooperation, the best execution of his designs, and the most reliable source of supply. That Federal-Mogul is the outstanding choice of scores of engineers as standard equipment is unquestioned evidence that it pays to replace with Federal-Mogul.

## Specialized Design

WHEN you buy a Hug Roadbuilder you buy a truck that does the job of building roads to perfection at the lowest operating cost. You don't buy a conventional chassis altered into a roadbuilding truck. Hug success is the result of specialized design. Each unit used in the construction of the Hug Roadbuilder is selected because it is best adapted to do a specialized type of work most efficiently. Hug specialization means a sturdier Roadbuilder at the right price.

Distributors capitalize on Hug specialized features of design. Desirable territory open for responsible distributors and dealers. Liberal floor plan and service parts arrangements.

THE HUG COMPANY, Highland, Illinois

**UNBREAKABLE** TAIL LAMP

> Unbreakable-Made of rubber, bends instead of breaking. Water Proof-Rubber is the best insulation, also proof against water.

Bright Light-Due to special unbreakable lens.

Vibration—No effect on electric bulb because it is hung loose in lamp, is surrounded by rubber and cushioned by a light spring.

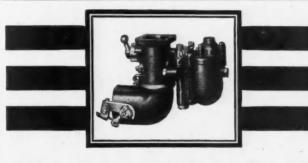

Guaranteed-Unbreakable.

Price \$5.00

## In-Built Quality-

For permanent consumer satisfaction nothing can take the place of In-Built Quality. It's the trump card that Dealers hold when they handle Selden Hahn trucks. The keener the competition the more important quality becomes and this in-built factor is benefiting Selden Hahn Dealers every day.

Selden Hahn understands the problems of the Dealer. It has provided him, first with a quality truck that enables him to outpoint competition and second with a dealer plan that is a real profit opportunity.

## THE ZENITH UNIVERSAL

The Zenith Universal Carburetor embodies many combined features necessary for efficient operation of trucks, buses and industrial equipment, and advisable for passenger car equipment.

Its automatic accelerating and economizing feature insures maximum power when needed, and marked economy of operation.

Its float arrangement enables it to function perfectly up and down steep hills, in and out of excavations, etc.

It is fully balanced so that efficient air cleaning devices may be fitted without danger of crankcase dilution.

Its spring loaded strangler insures easy starting and continued running in the coldest weather.

Its stainless steel parts insure long life and no corrosion in vital moving parts.

Its heavy construction makes it durable under the hardest conditions of use.

It is easy to clean and to service. It can be supplied with or without an adjustment.

It can be sold at an attractive price.

Full details on request.

## Linked with Leaders

AMONG the names which stand out as automotive leaders of the day, Hyatt has an enviable record of consistent achievement, a royal lineage and a fine heritage of faithful service.

Appreciation of Hyatt design has ripened with the years. Proven performance over more than a quarter century of automotive progress has broadened the commanding position Hyatt enjoys.

Hyatt Quiet Roller Bearings in all these years have never failed to meet these exacting requirements: excellence of design . . . precision manufacture . . . long life . . . faultless performance . . . silent efficiency.

A plain fact...one which unquestionably points to universal preference...is that the advantages of Hyatt protection are always linked with the leaders.

## GIVE YOUR DRIVER A BRAKE !.. and a "break"

Give your drivers a "break"—with Bendix Brakes. You'll cut your costs.

Bendix "Servo" action—an exclusive feature—uses the momentum of the vehicle for stopping energy; draws that force from the rotating wheels; multiplies normal leg-power into tremendous stopping power.

Bendix Brakes are tightly enclosed, for uniform efficiency in all weather. They are simple, rugged.

It's common-sense equipment—Bendix Brakes; particularly logical for heavy-duty commercial vehicles—a fact which more and more operators are learning from first-hand experience.
